## Summary

- The M3ENP model is being used to examine the effects of existing and proposed water management alternatives on the hydrologic resources of ENP.
- Detailed water budgets can be calculated that allow us to assess surface and groundwater flow, canal flows, and seepage into and out of the detention areas

## Summary

- In this study, a seepage barrier between the Frog Pond detention areas and the C111 will redirect water towards the center of Taylor Slough
- The Frog Pond barrier resulted in an increase of flow at Taylor Slough Bridge of 14 kaf, or 30%
- A barrier along the SDA increased this effect slightly, and has a larger effect if used *in addition* to the Frog Pond barrier

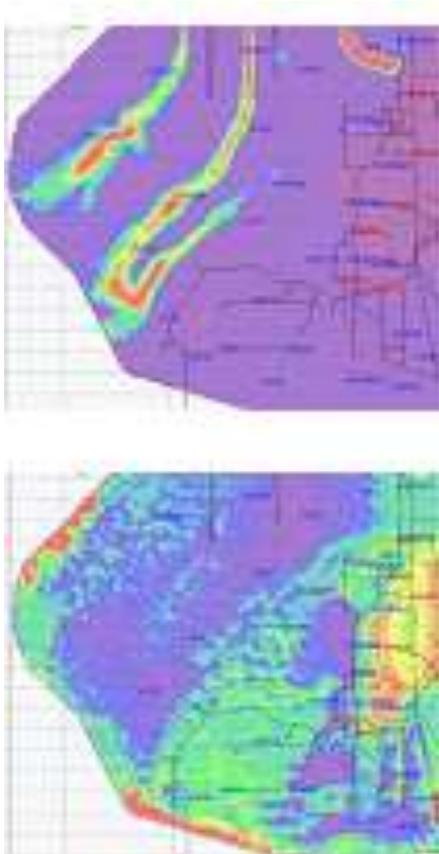

## Next Steps Include:

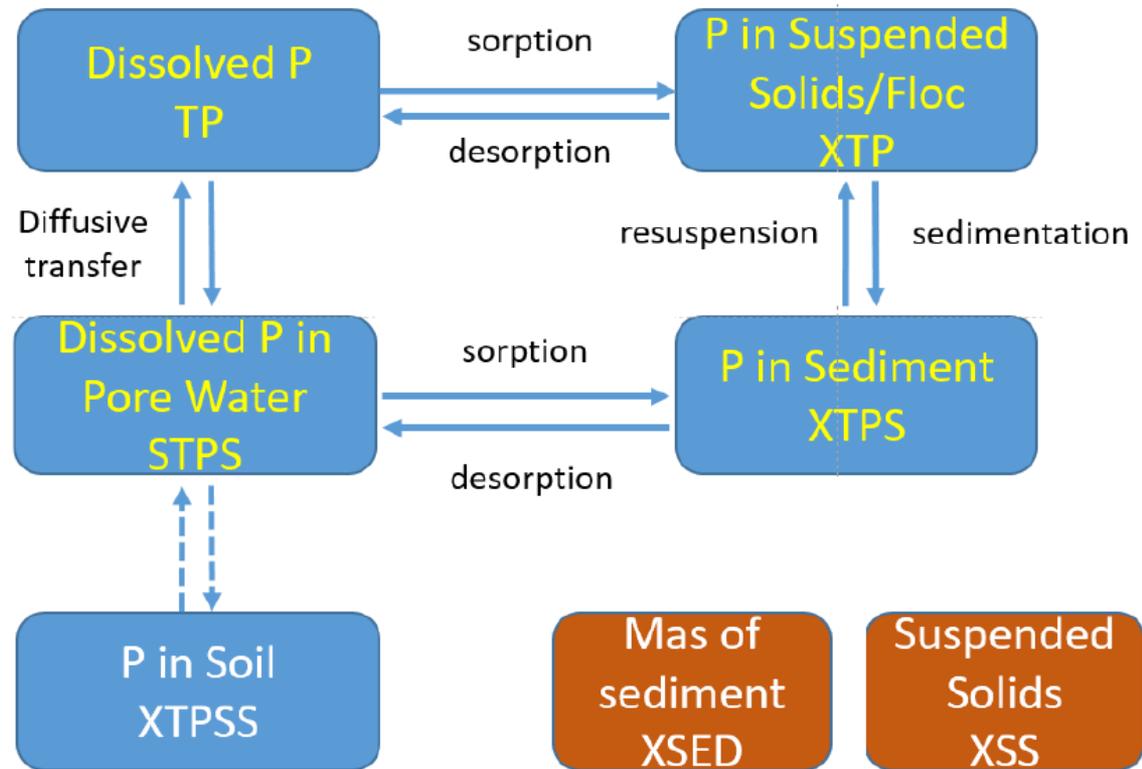

- Seasonal operations
- Incorporate RSM into boundary conditions
- Model comparisons with RSM and 2x2
- Application of Water Quality Model...
- Expanded domain...
