Sawgrass

Tree Island

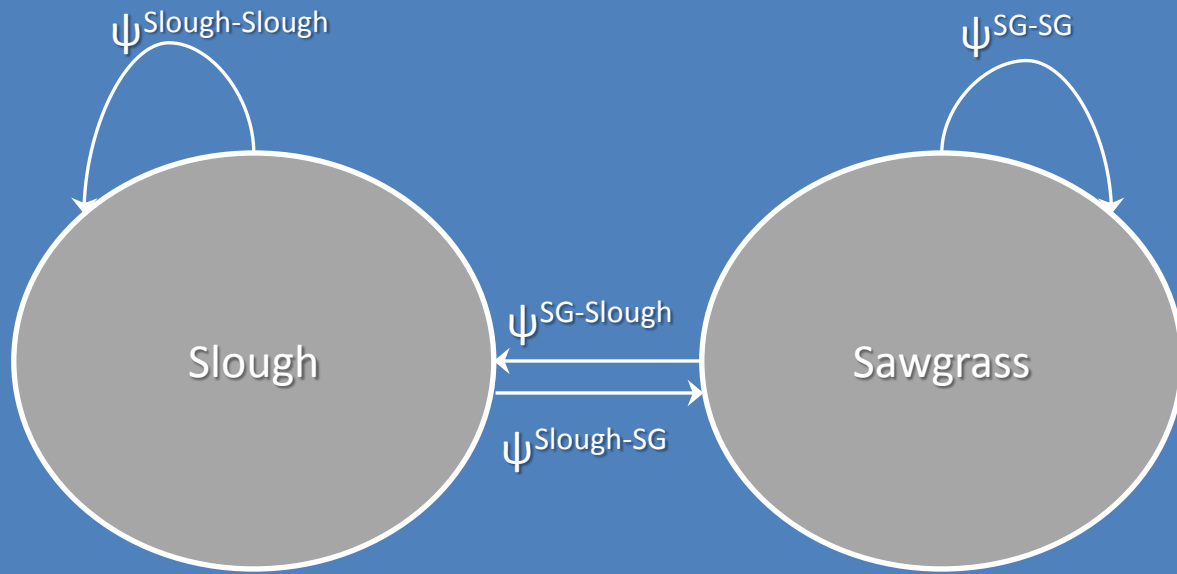

Slough

Modeling vegetation communities change

Multistate models

- Survival/movement(ϕ) and detection (p)
- Survival (S) detection (p) and movement (ψ)

$S(1)p(1)\psi(\text{environmental factors})$

1988

1993

1999

2003

2007

Hypotheses

$S(1)p(1) \Psi(g), S(1)p(1) \Psi(t), S(1)p(1) \Psi(g*t)$

- $\Psi(\text{Avg Maximum of previous 5,10,20,30 years})$
- $\Psi(\text{\%iles of previous 5,10,20,30 years})$
- $\Psi(\text{Maximum of previous 5 years})$
- $\Psi(\text{Moderately dry conditions of previous 5 years})$

Final Model

$S(1)p(1)\Psi(\text{Maximum of previous 5 years} * t)$

Slough - SG (north)

SG - Slough (north)

Slough - SG (south)

SG - Slough(south)

Future directions:

- Predictive model/map
- Other predictors such as peat, elevation, etc.
