

A large photograph of a wetland landscape with a river winding through it, surrounded by dense vegetation and reeds.

# The Effects of Wastewater Discharge, Agriculture and Papyrus Harvesting on the Nutrient Regulation Function of Namatala Wetland, Uganda

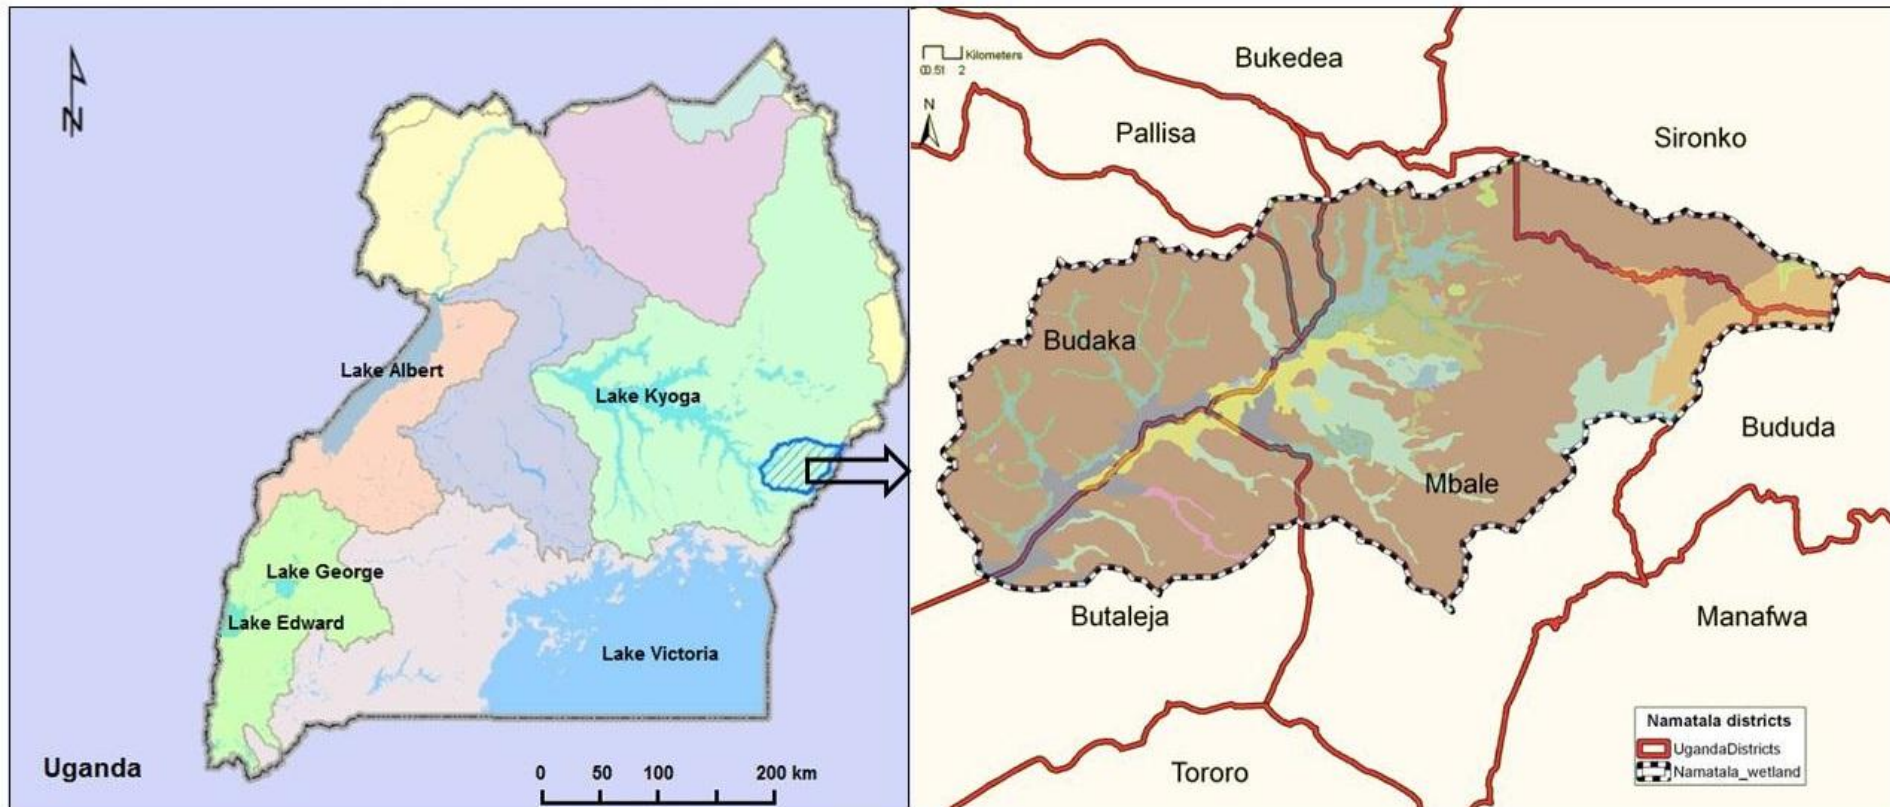

Susan Namaalwa<sup>1</sup>, Anne A. van Dam<sup>2</sup>, Ajie Guruh<sup>2</sup>, **Rose C. Kaggwa<sup>1</sup>** and Andrew Sekayizzi<sup>1</sup>

<sup>1</sup>National Water and Sewerage Corporation, Kampala, Uganda

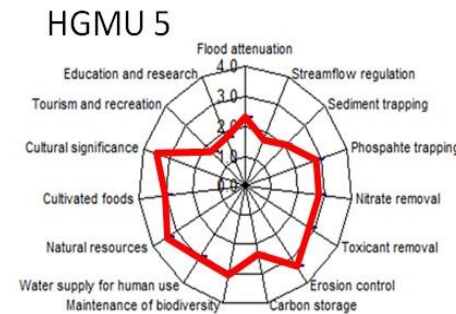

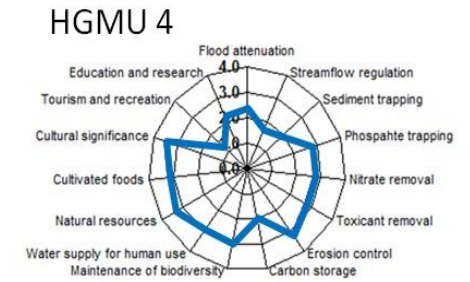

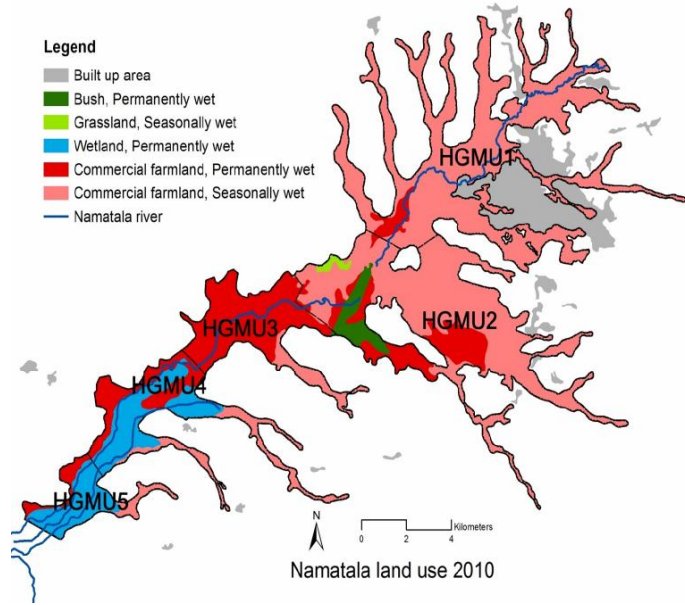

<sup>2</sup>UNESCO-IHE Institute for Water Education, Delft, The Netherlands

# Introduction: Geographical context

- Wetland area : 260 km<sup>2</sup>
- Altitude: 3,550 – 3,700 m
- Population: 380,000

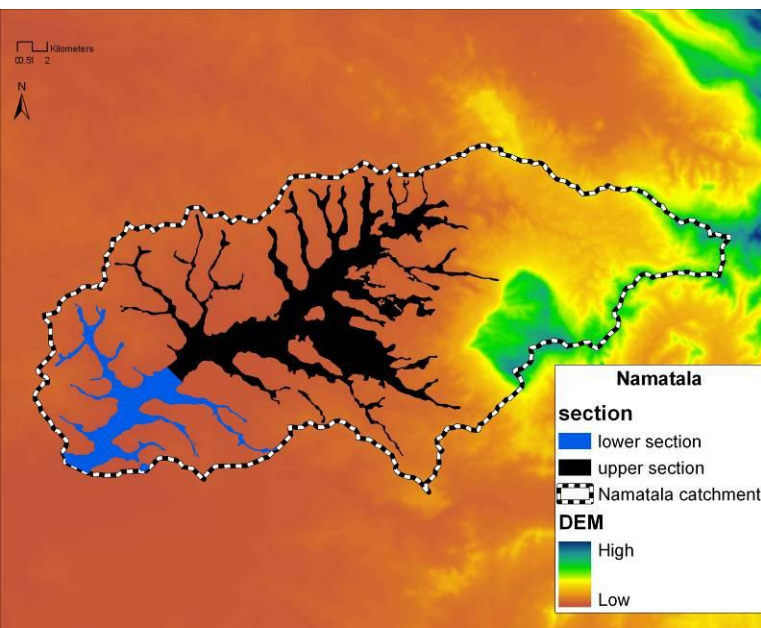

# Introduction...../2: Ecosystem Services

| Ecosystem service | Score for HGMU no. |     |     |     |     |
|-------------------|--------------------|-----|-----|-----|-----|
|                   | 1                  | 2   | 3   | 4   | 5   |
| Provisioning      | 2.3                | 3.0 | 3.1 | 3.2 | 3.1 |
| Regulating        | 1.9                | 1.9 | 2.1 | 2.5 | 2.5 |
| Cultural          | 1.2                | 1.8 | 1.8 | 2.3 | 2.3 |
| Habitat           | 1.6                | 1.8 | 1.8 | 3.0 | 3.0 |

| Wetland pollution               | 4              | 2                               | 3                               | 4                            | 3    | 3                | 1                 |
| Conflicts in use and ownership  | 2              | 5                               | 5                               | 2                            | 4    | 4                | 2                 |
| Diversion of streams and rivers | 1              | 4                               | 4                               | 5                            | 5    | 5                | 3                 |

(Source: Namaalwa et al. 2012, submitted)

- ✚ Priority ranking (1=high to 5=low)
- ✚ Priority ranking: Based on average of the five scores
- ✚ Agreement ranking based on coefficient of variation (lower variation representing higher agreement on issues)

# Objectives

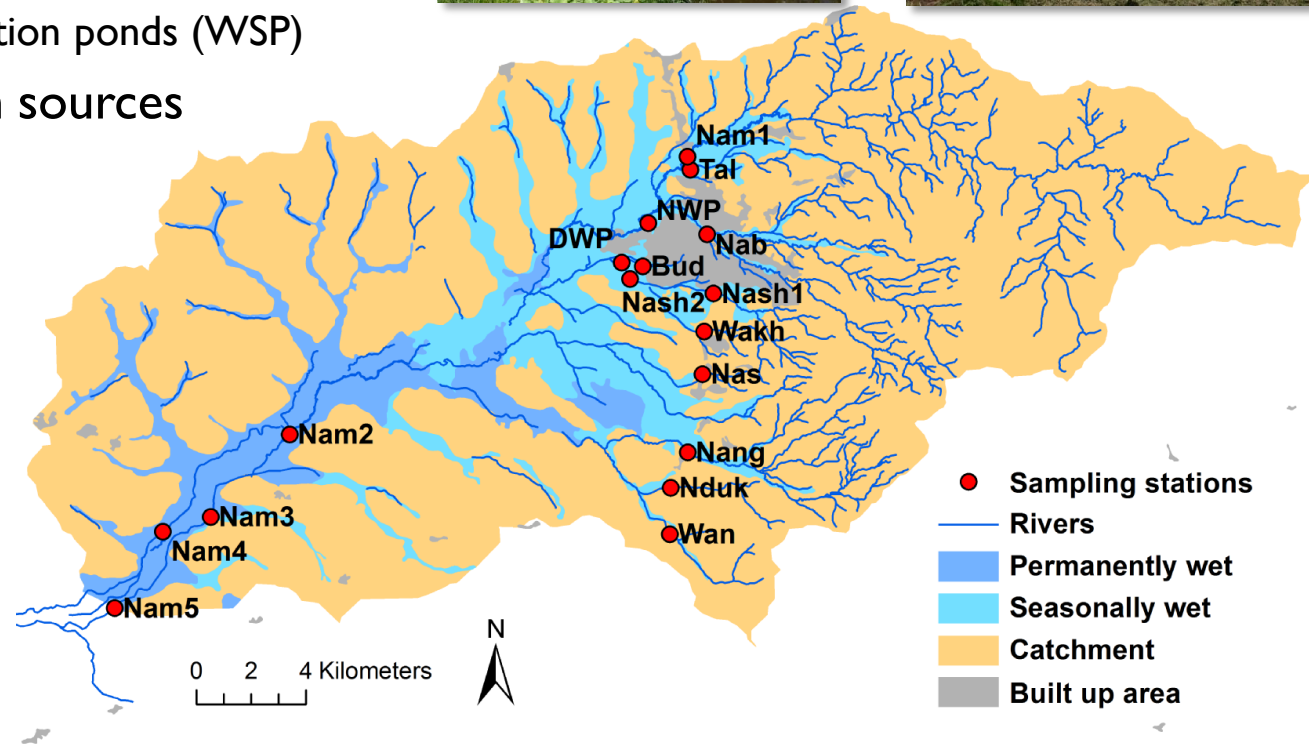

- Characterize the water quality status of the case study – Upstream - downstream interactions
- Compare total nitrogen (TN) and phosphorous (TP) input into Namatala wetland from the main river, other tributaries, and from the wastewater treatment systems
- Estimate the export of TN and TP through rice and papyrus harvesting

# Research methods

## Field work (November 2009 – August 2011)

- Delineation of study area
- Selection of sampling points
  - main river channel
  - other streams
  - polluted streams
  - waste stabilization ponds (WSP)
- Mapping of pollution sources

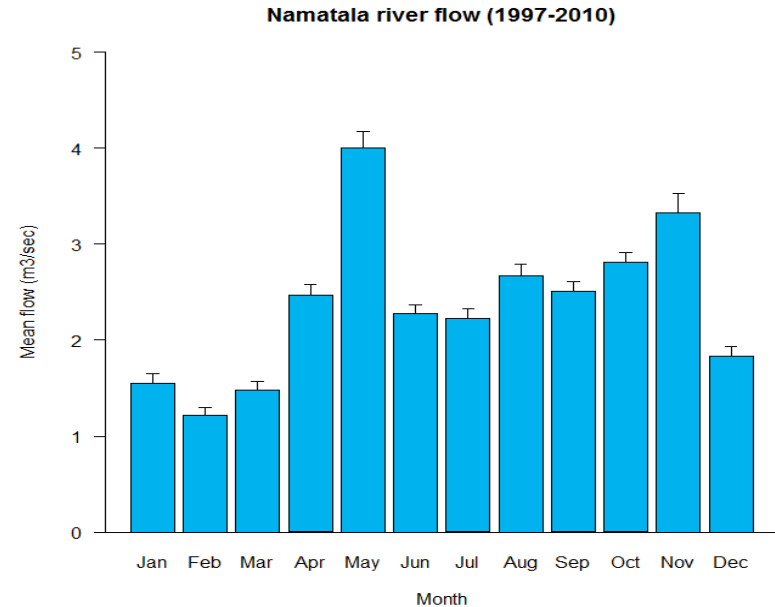

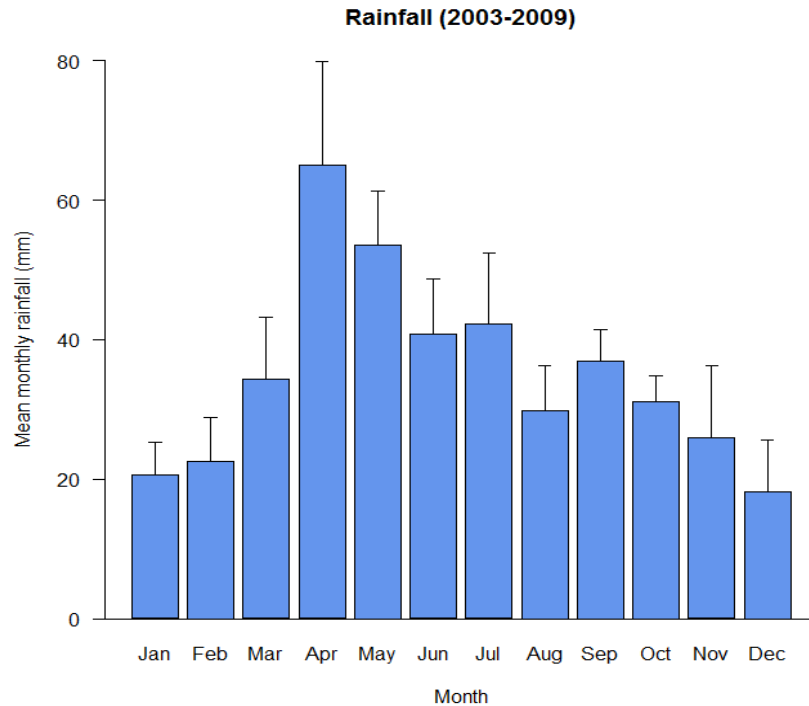

# Research methods ...../2

- ✚ Water sampling & Analysis
- ✚ Discharge monitoring
- ✚ Plant sampling & analysis for nutrients

# Precipitation & discharge

- ✚ High rainfall variability
- ✚ Peak rainfall observed between April & June; Sept & Nov
- ✚ High flows observed in May and October & November i.e. rainy seasons

# Discharge of wetland inflows

Namatala river

✚ Higher discharge for all the inflows observed during the peak rainfall period (April-May)

Other streams

✚ Namatala river is the major source of surface water input contributing 70% of the flow

Polluted streams

✚ Average discharge (m³/sec) : River (1.1 & 5.6) ; other streams (0.11 & 0.78) for dry & wet season respectively

Wastewater ponds

✚ Average discharge (m³/sec): polluted streams (0.094 & 0.006); WSP (0.008 & 0.003) for dry & wet seasons respectively

Month

# Water quality: pH & DO

Neutral pH for Namatala river and other inflowing tributaries ( 7.3 – 7.5). High pH observed in the effluents WSP ( 8.8 -10).

High DO values in Namatala river & other streams (4.5 – 5.6mg/l). Low values in polluted streams & WSP effluent (0.7 – 2.5mg/l)

# Water quality: EC & TSS

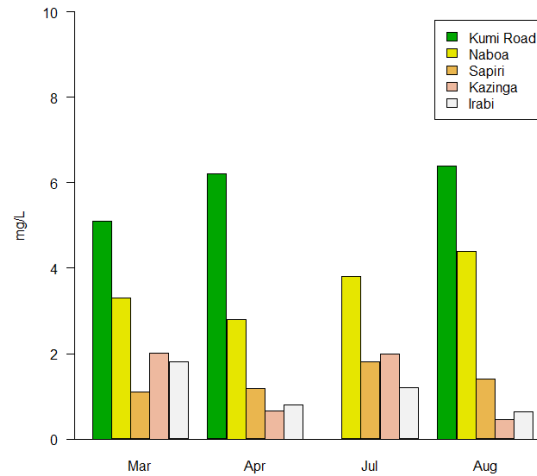

- High EC values in the polluted streams (1005 – 1106 µs/cm ) and WSP effluent (785 – 951µs/cm )
- High TSS values observed in the polluted streams (170 – 216mg/l) & WSP effluents (140 mg/l).

# Upstream-downstream variation of pH, DO, TSS & EC

pH

Dissolved oxygen

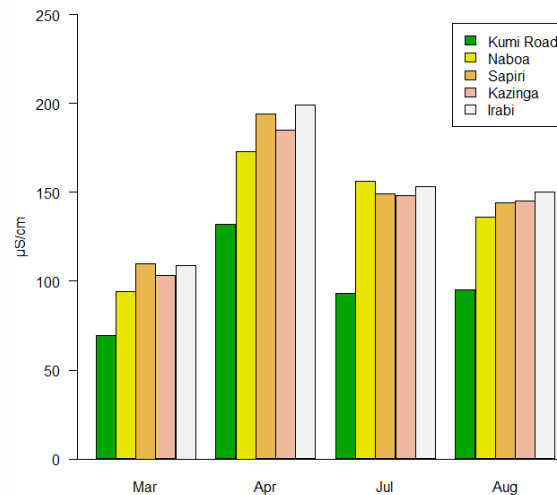

✚ Lower pH (6.5 -6.8) & DO (1.1 – 2.9 mg/l) recorded at the downstream points

Total suspended solids

Electrical conductivity

✚ EC (145 -237 µs/cm) & TSS (40-78 mg/l) values are comparably high in the downstream

# Water quality:TN

Namatala river

Other streams

Polluted streams

Wastewater ponds

✚ Low concentration in the river ( $1.35 \pm 0.11$  mg/l)

✚ Slightly higher values in other inflowing streams (1.052 – 1.5 mg/l)

✚ Much higher concentrations in the inflows of WSP (11.7 -14.9 mg/l) and the two polluted streams (7.6 – 19.3 mg/l)

# Water quality:TP

Namatala river

Other streams

Polluted streams

Wastewater ponds

✚ Low concentration in the river ( $0.44 \pm 0.30$  mg/l)

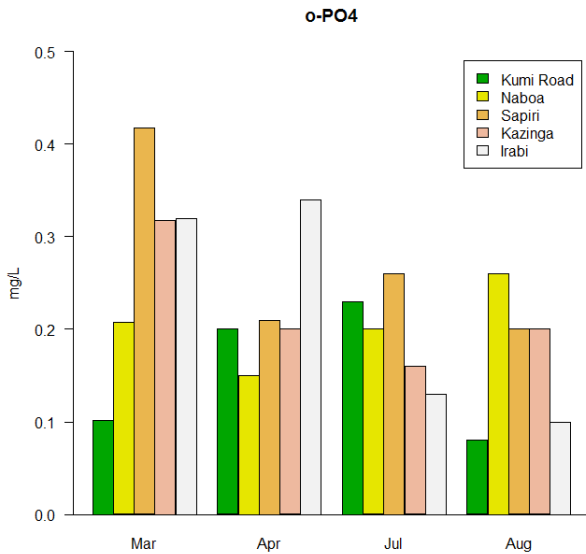

✚ Slightly higher values in other inflowing streams (0.406 – 0.533 mg/l)

✚ Much higher concentrations in the inflows of WSP (4.44 -4.68 mg/l) and the two polluted streams (1.59 – 2.86 mg/l )

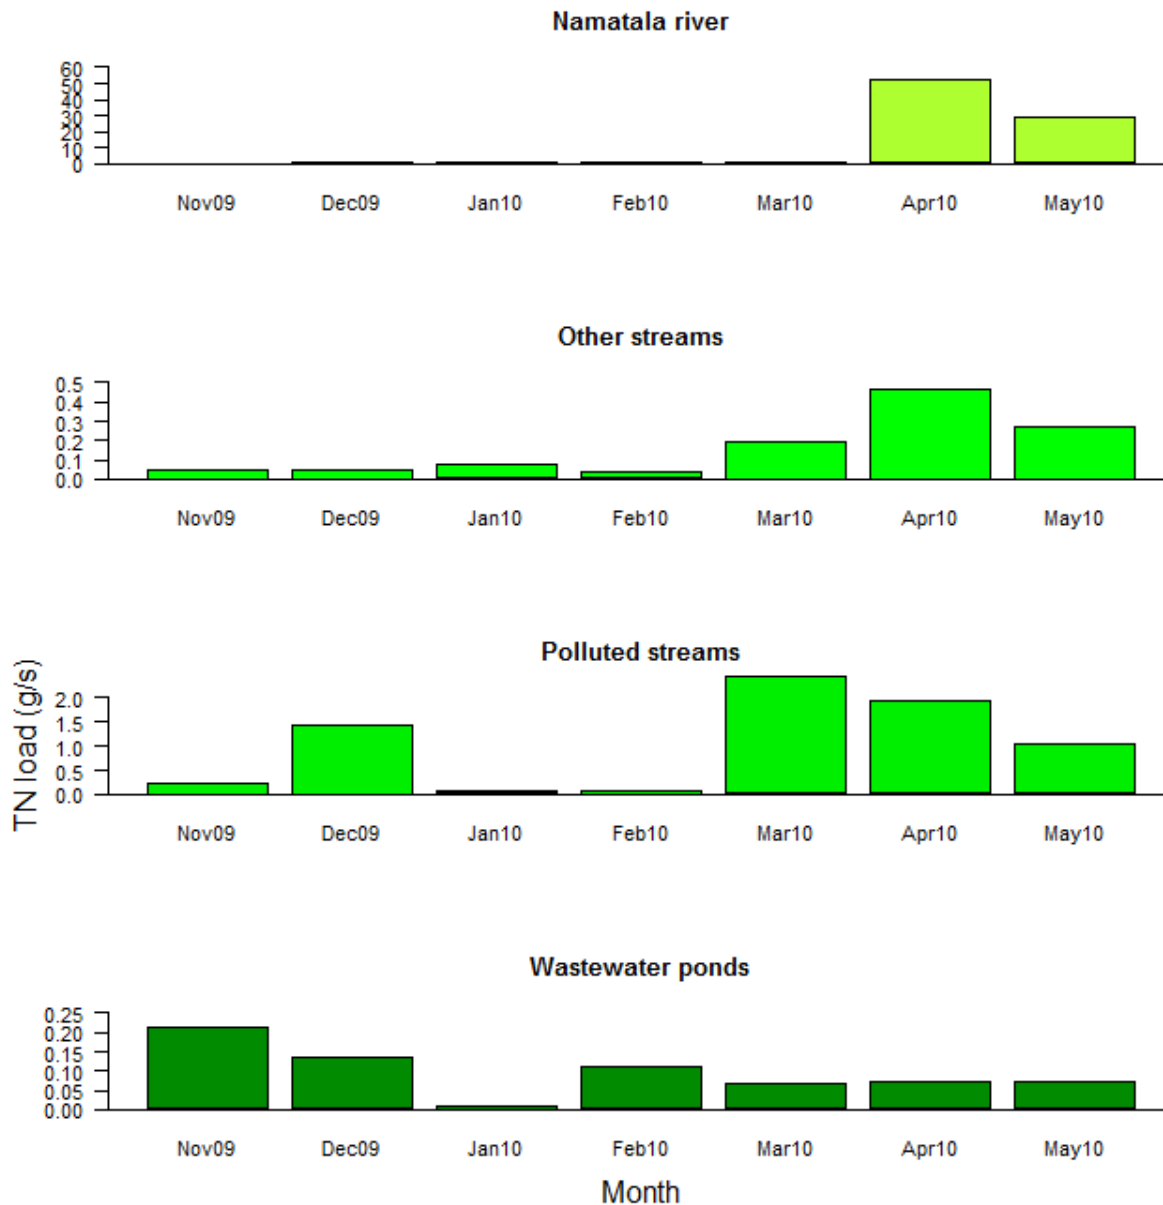

# Upstream–downstream variation of NH<sub>4</sub>, TN, PO<sub>4</sub> & TP

✚ High concentration of TP  
( $0.728 \pm 0.362$ ) in the river  
outflow

# TN loading from inflows of the wetland

✚ High TN loading for all the inflows observed during the peak rainfall period (April-May) reaching 52 g/s in the River

✚ Namatala river is the major source of TN loading contributing about 78%

✚ Considerably high loading observed in the polluted streams

# TP & TSS loading from inflows of the wetland

Namatala river

Namatala river

Other streams

Other streams

Polluted streams

Polluted streams

Wastewater ponds

Wastewater ponds

- High TP & TSS loading observed during the peak rainfall period (April-May).
- Higher loads found in the river reaching 6.15 g/s & 2056 g/s of TP & TSS respectively

# Removal of nutrients: rice & papyrus harvesting

|                  | Nitrogen (tonnes) |            |              | Phosphorous |            |              |
|------------------|-------------------|------------|--------------|-------------|------------|--------------|
|                  | Dry season        | Wet season | Total (year) | Dry season  | Wet season | Total (year) |
| <i>Loading</i>   |                   |            |              |             |            |              |
| river            | 9.1               | 264.2      | 273.3        | 1.5         | 30.6       | 32.1         |
| other streams    | 1.1               | 2.4        | 3.5          | 0.3         | 0.9        | 1.2          |
| polluted streams | 1.1               | 22.6       | 23.7         | 0.4         | 2.6        | 3.0          |
| WSPs             | 0.9               | 1.8        | 2.7          | 0.2         | 0.4        | 0.6          |
| Total loading    | 12.3              | 290.9      | 303.2        | 2.4         | 34.5       | 36.9         |
| <i>Removal</i>   |                   |            |              |             |            |              |
| rice             |                   |            | 134.4        |             |            | 40.0         |
| papyrus          |                   |            | 3.7          |             |            | 1.6          |
| river outflow    | 30.1              | 146.4      | 176.5        | 5.3         | 28.5       | 33.8         |
| Total removal    |                   |            | 314.6        |             |            | 75.4         |

- ✚ N removal by rice & papyrus harvesting is estimated at 45.5% of the total N- load
- ✚ P removal by rice & papyrus harvesting is much higher than the load
- ✚ Much higher export of P than N through rice and papyrus harvesting

# Summary & Discussion

- ✚ High concentrations of N & P were consistently observed in the polluted streams draining the urban centre of Mbale, an indication of the influence of activities within the catchment
- ✚ High discharge during the peak rainfall season influences nutrient loading into and out of the wetland
- ✚ Lower concentrations of N & P in the river outflow is indication of the wetland potential to remove nutrients
- ✚ N load and removal is balanced; more P is removed than loaded

THANK YOU
