# Salt Flat Production

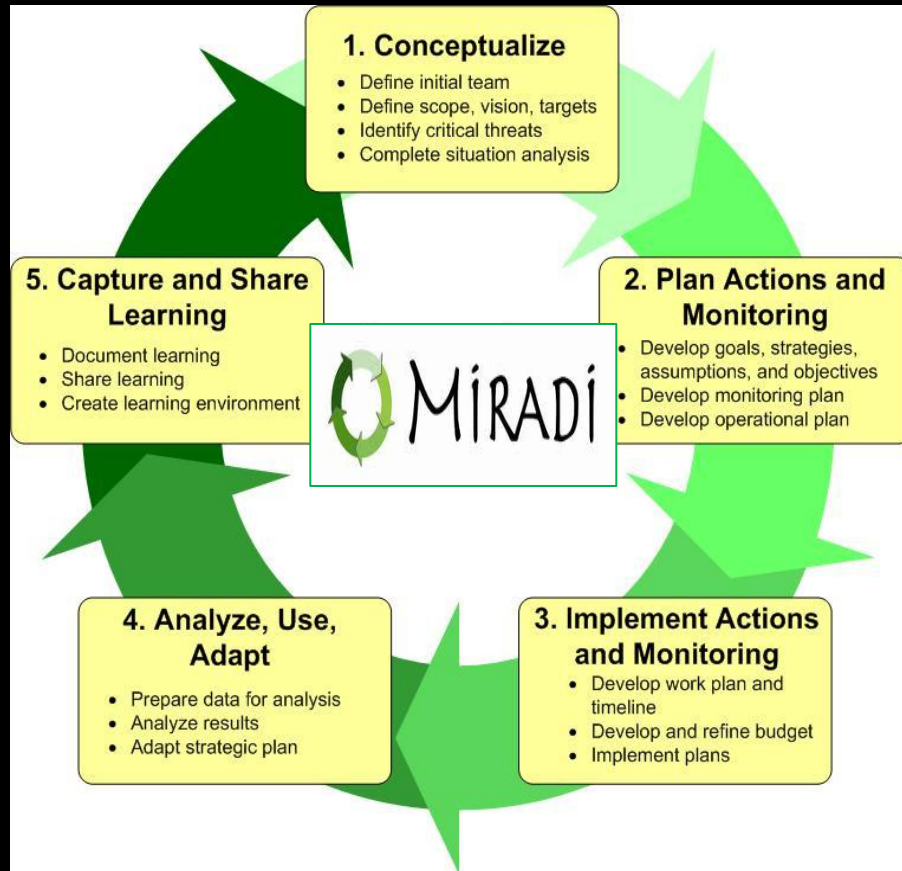

# Temporal Scope: Nesting and migration of shorebirds during wet and dry seasons

# GOAL: Provide high quality nesting and foraging habitat through the active management of hydrology while allowing salt production

# Qualitative & Quantitative Approach

Elicitor Software

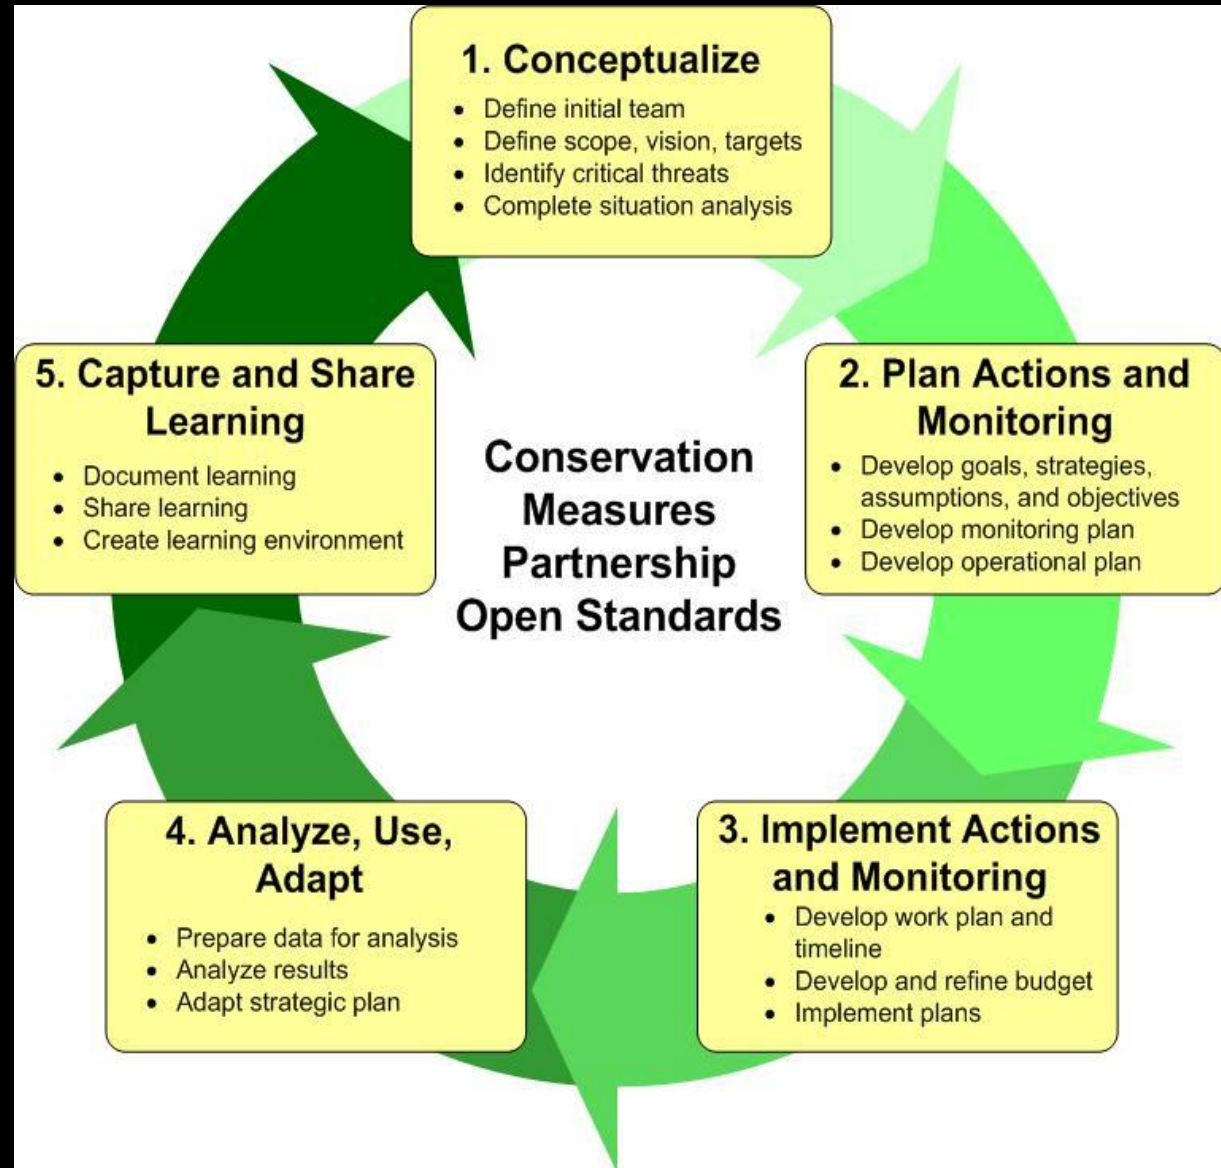

# Open Standards for the Practice of Conservation

## Step 1:

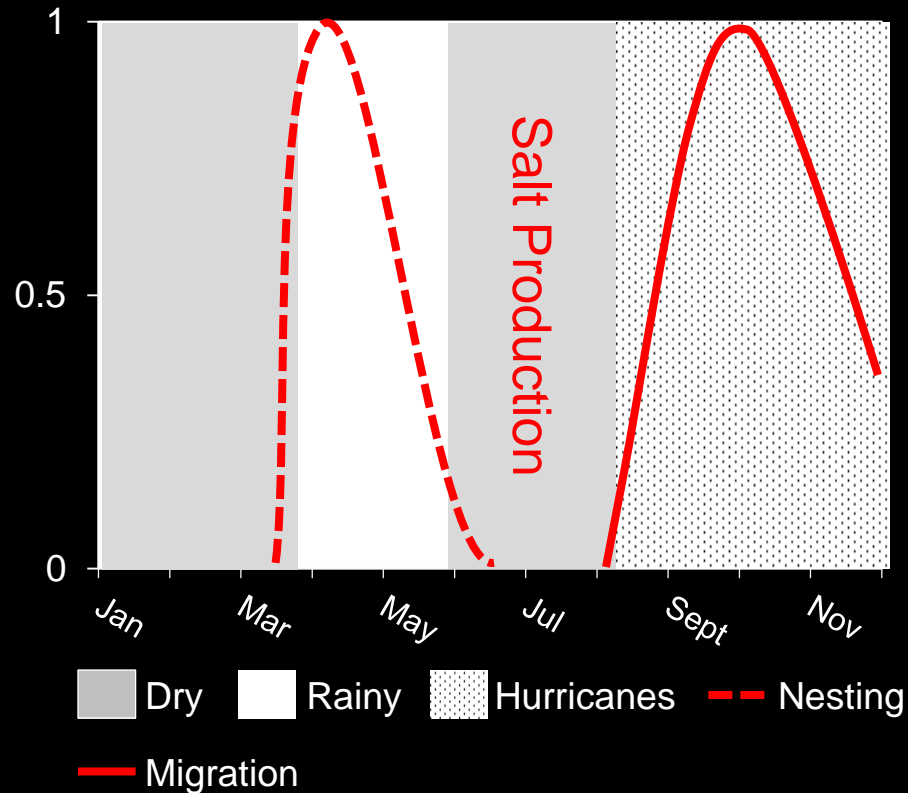

- Define scope, vision, targets
- Identify critical threats
- Complete situation analysis

## Step 2:

- Develop goals, strategies, assumptions, and objectives

Scope: Shorebird nesting and foraging habitats during migrating season (late July to early January with peak times in late August to late October)

Vision: A managed system to support quality feeding and nesting habitat for aquatic birds and salt production

# Conservation Targets

## Nesting habitat

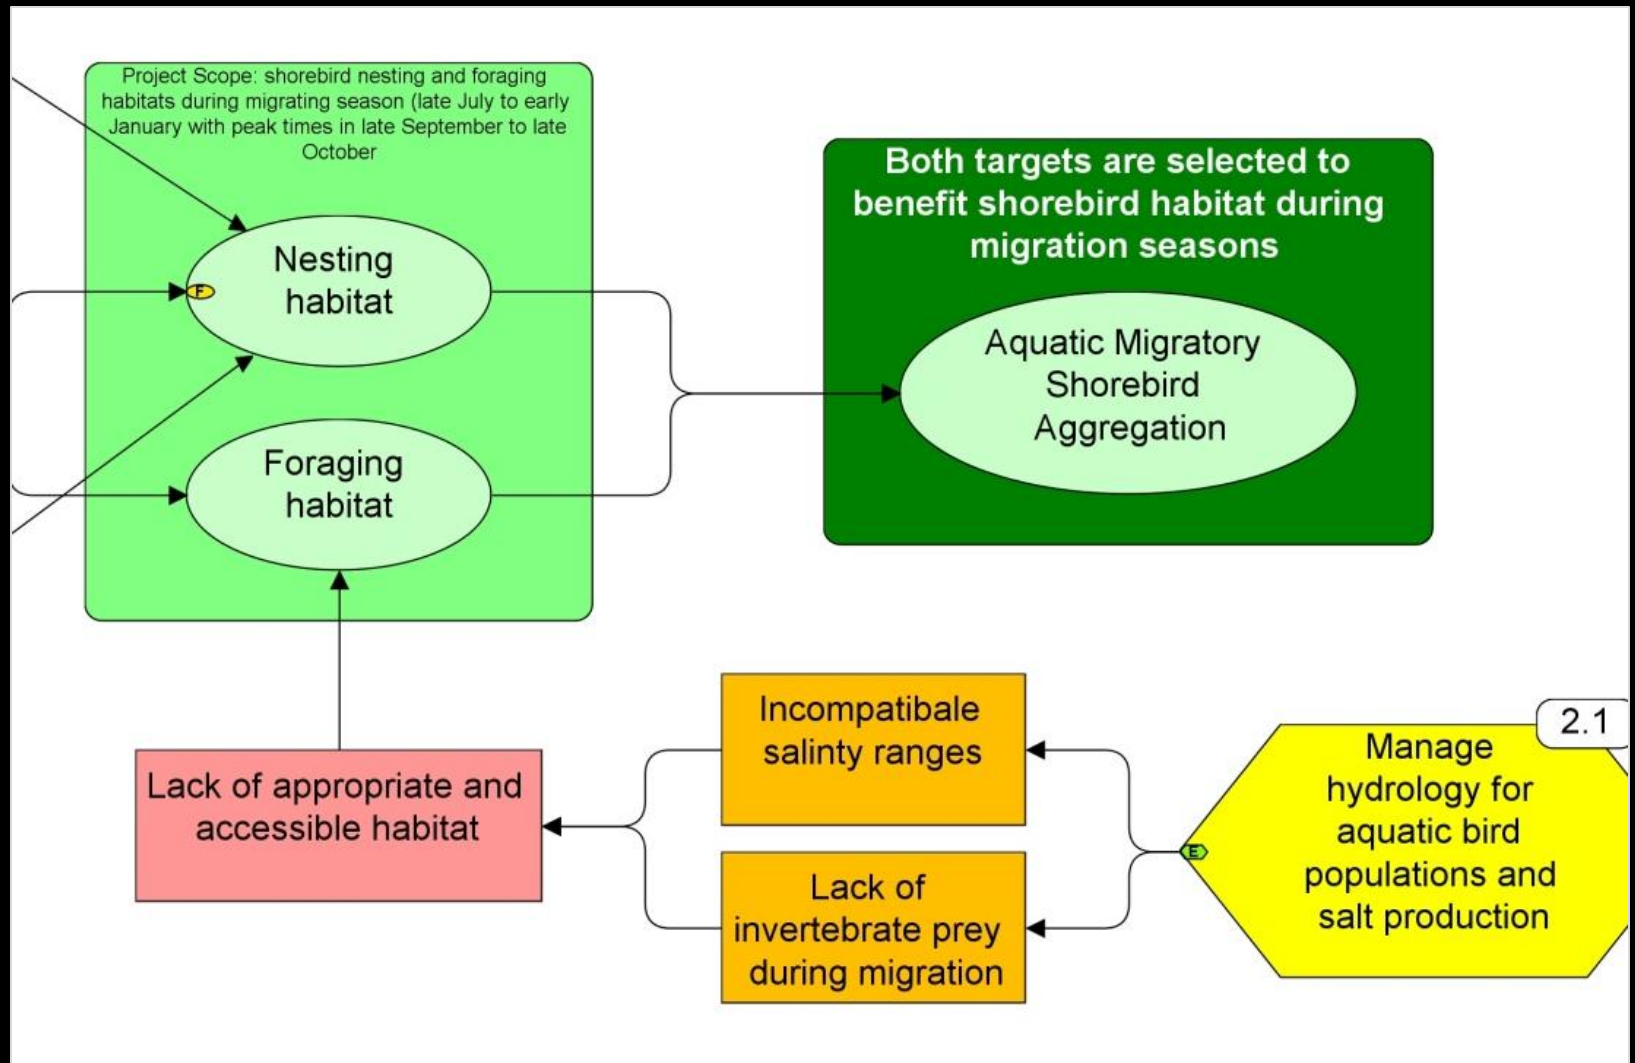

Clear, open spaces with slight elevations in micro-topology or "mounds" protected from minor flooding

## Foraging habitat

Accessible (<10cm); salinity (<35ppt to 100ppt); abundant source of invertebrate prey (moist soils and substrates).

# Scenarios

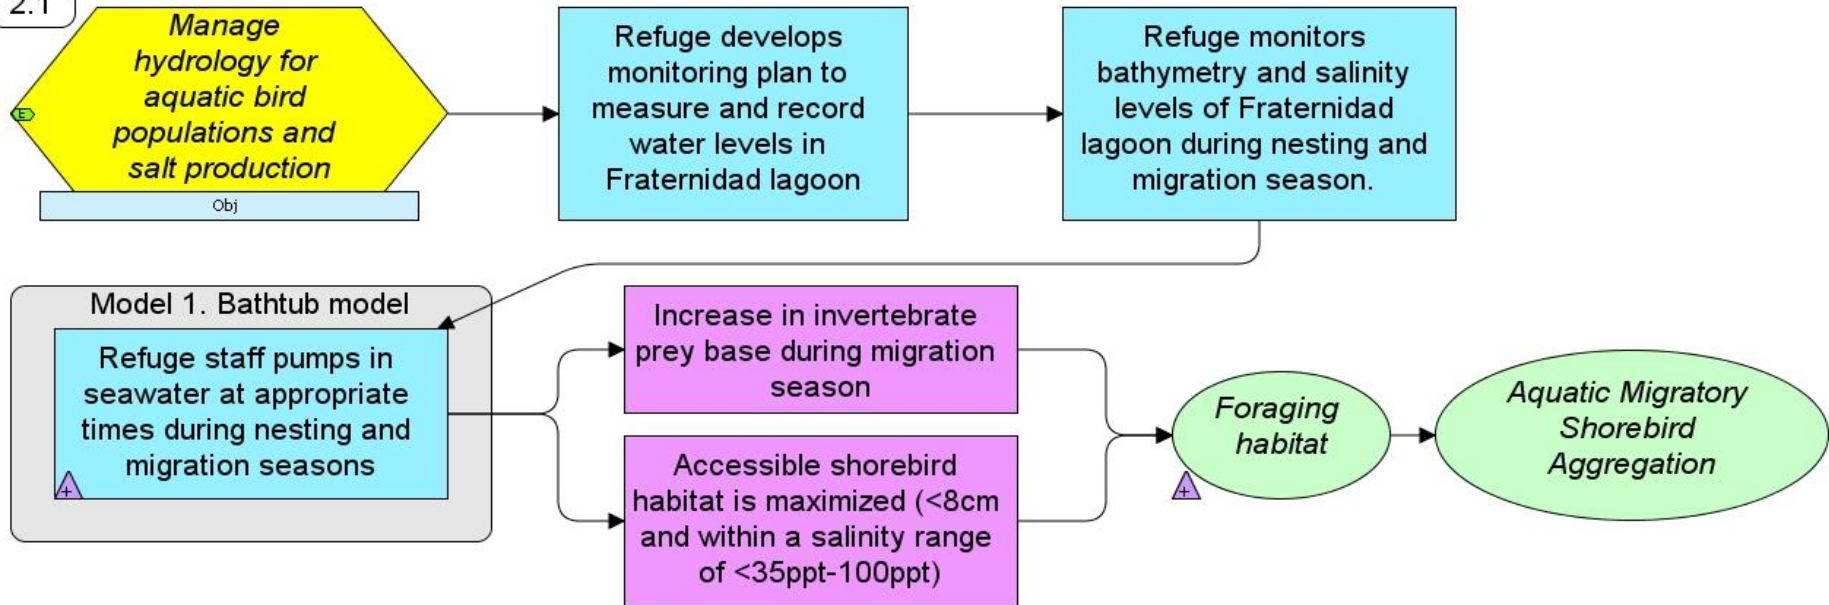

Please think back to the past five years of your experience observing birds at Fraternidad lagoon. At the **end of migration season (late November to early December, at the end of the hurricane season)**, what is the **minimum number of birds**, of all the birds present at Fraternidad lagoon, would you expect to see in **cell/area C**? How sure are you? **100%** sure of your answer?? Can you bring in these limits – to be more informative – so that you're **95%** sure?

# OUTPUT

2.1

**Indicators**

**Monitoring strategy**

**Objective 1.** Maximize foraging opportunities by managing hydrology for aquatic bird populations

By July 2013 foraging habitat will increase by XX% increase (use average of the past five years as a baseline).

- Greater % of birds during the season use more habitat for foraging (BEHAVIOR)
- Improved nest success

Observations of foraging behavior

Field observations of nest predation or disturbance

**Objective 2.** Manage hydrology to provide water quality (ppt) and quantity to allow for salt production

By July 2013 there will be XX amount of water at a salinity range over 120ppt available to be pumped for crystallizers for salt production during the months of Jan - March

- Salinity levels of water around crystallizers
- Observation of water quantity

Reports from salt operators

# Overall Approach
