

# BISCAYNE BAY NUTRIENT LOADS AND WATER QUALITY BOX MODEL

Frank Marshall,  
William Nuttle,  
Henry Briceno,  
Joffre Castro

Project Funding:  
National Park  
Service

INTECOL June 7, 2012

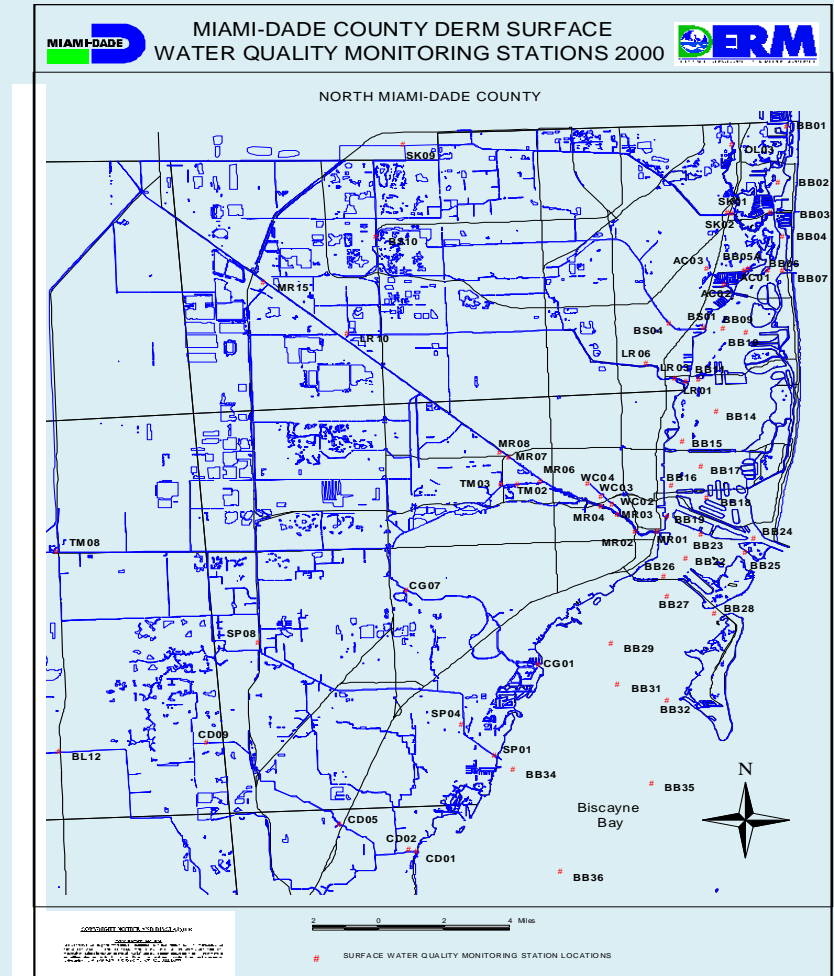

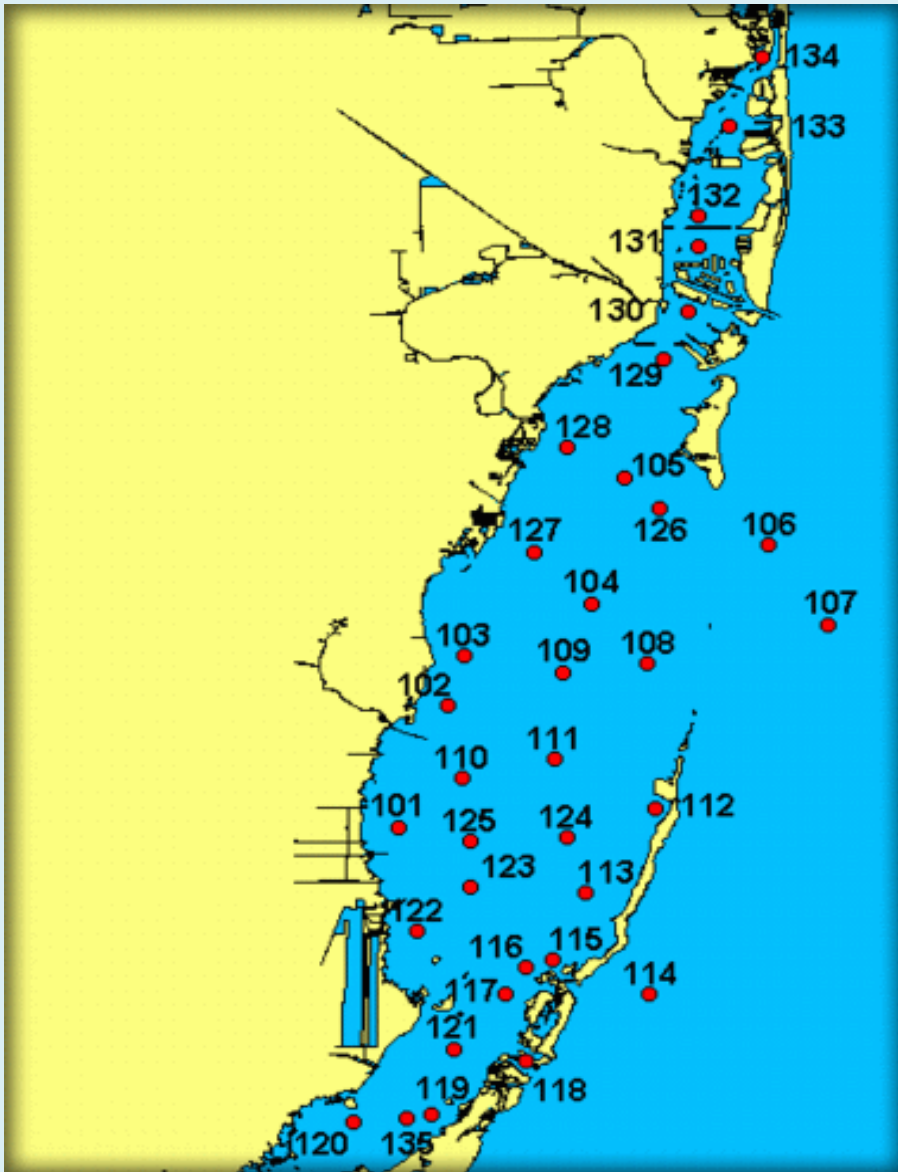

# Study Objectives

- Divide Biscayne Bay for box model use
- Estimate existing freshwater and nutrient loads to each box
- Upgrade an existing salinity box model for nutrient calculations
- Calibrate and run model for various load scenarios
- Compare to existing data and results of other studies
- Estimate the effects of changing land use

# General Study Area

# Existing Water Quality Data

# Existing Water Budget Data

| Receiving Water (box)        | Revised Drainage Basin Used in This Study                    | SFWMD Basins Comprising Drainage Basin   | SFWMD Canal        | SFWMD Structure      | DERM Canal Stations        | Open Water Monitoring Stations |                                    |

# Box Model Domain Development

- Biscayne Bay divided into boxes using bathymetry/geography and areas of similar water quality from a Principal Components Analysis
- Important:
  - Domain of box model is Biscayne Bay
  - Watershed basins not part of box model
  - Watershed basin loads aggregated by box

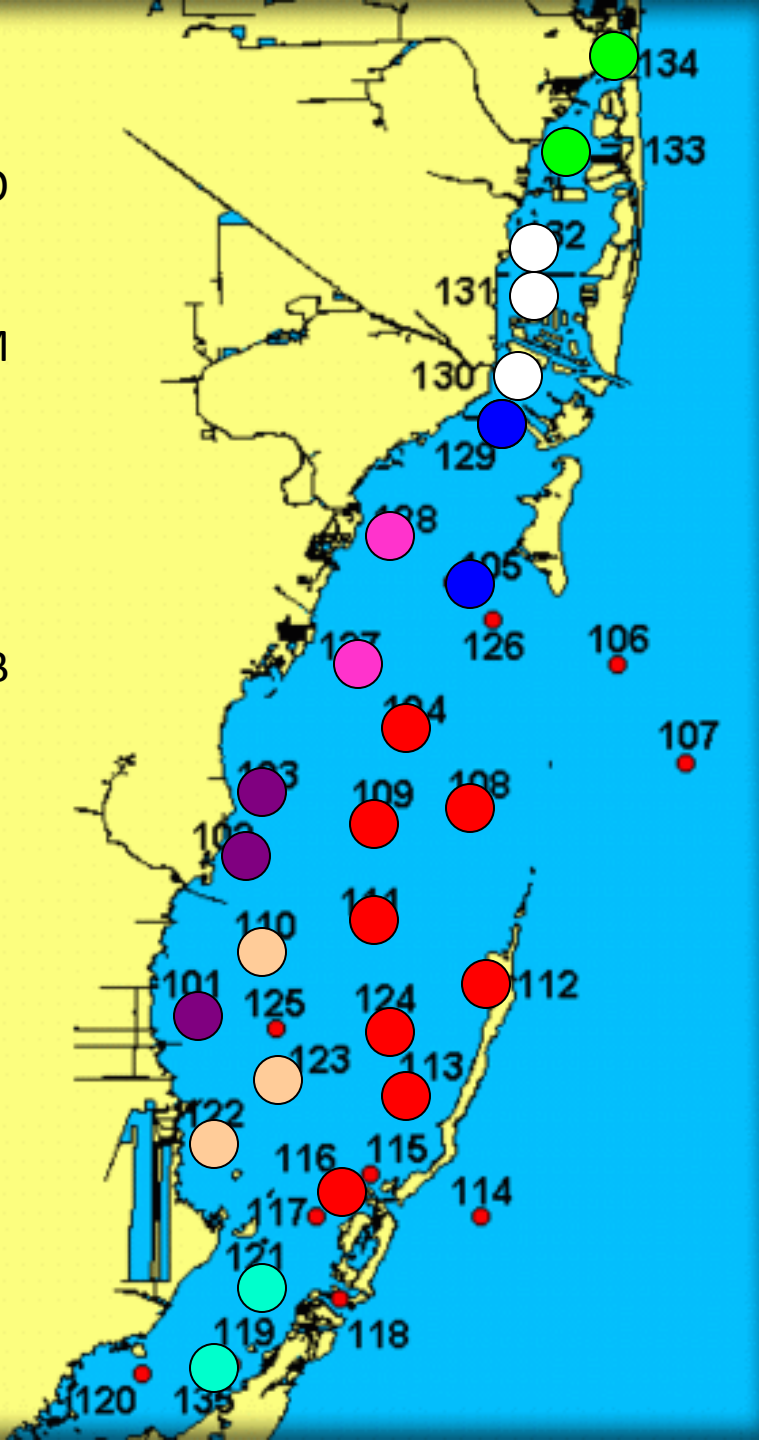

# Principal Component Analysis (PCA)

- PCA used to identify areas of similar water quality
- 4 methods used to develop clusters
  - PC extraction
  - Euclidean distance
  - Varimax rotation
  - Oblique solution

# Final Classification Scheme

Similar to classification of Florida Bay by Briceno & Boyer (2010) and Caccia and Boyer (2007)

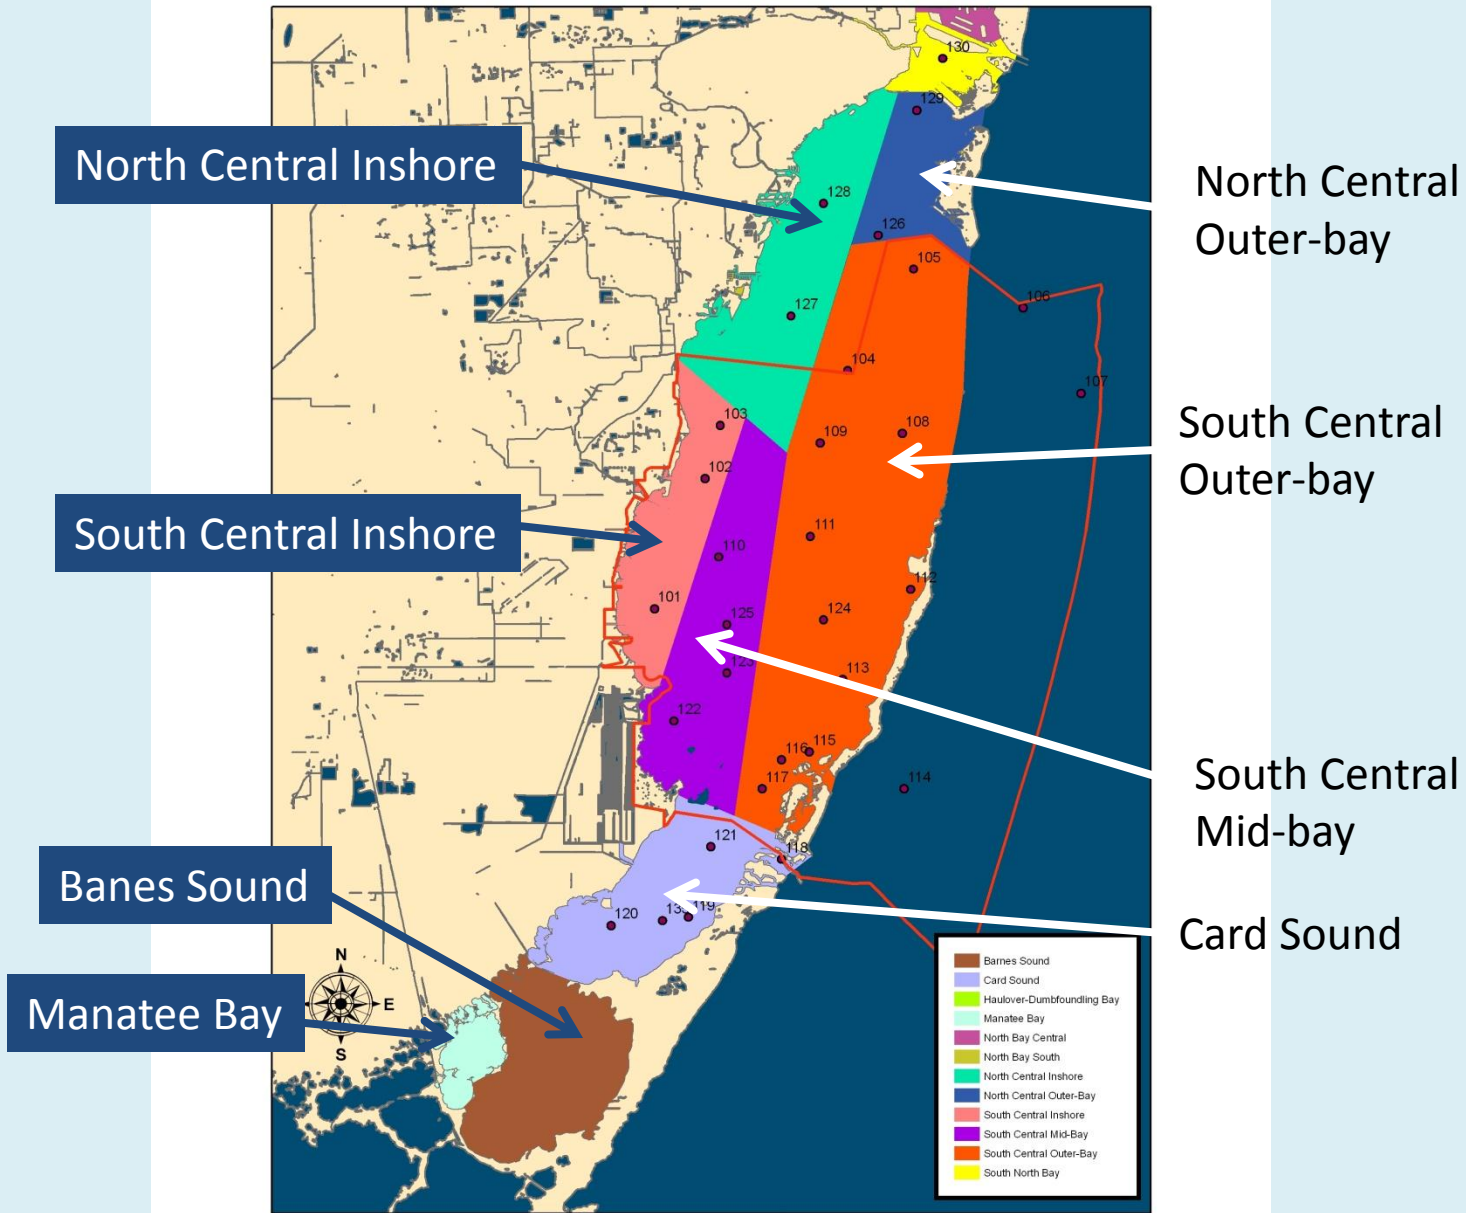

- NCI
- NCO
- SCI
- SCM
- SCO
- SCS
- SNB
- NNB

# Biscayne Bay Load Boxes

Caccia, V.G., Boyer, J.N., A nutrient loading budget for Biscayne Bay, Florida, Mar. Pollut. Bull. (2007)

# Water Budget – Single Box

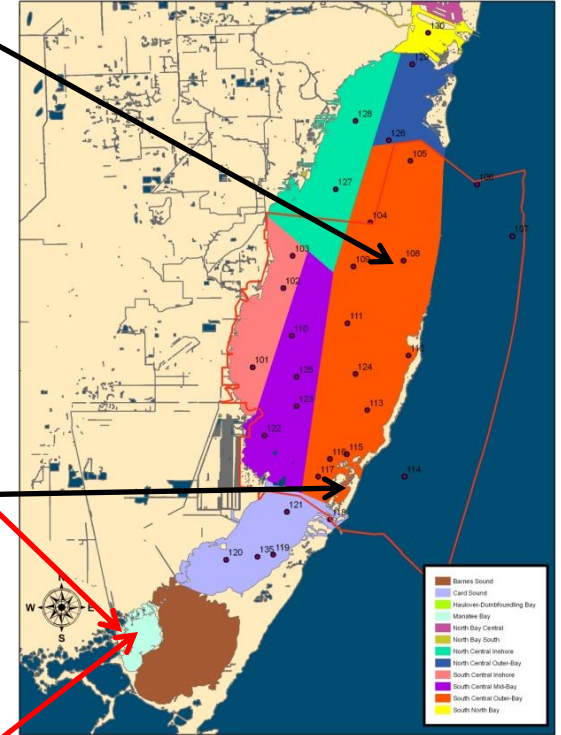

# Precipitation

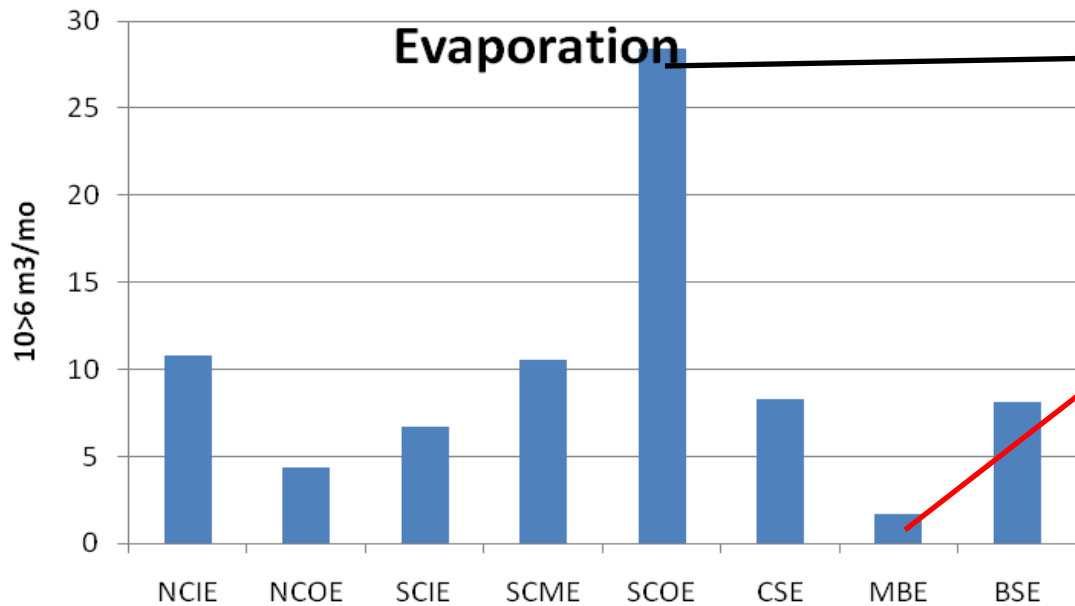

**Precip & evap:  
highly area-  
dependent**

# Biscayne Bay Load Boxes

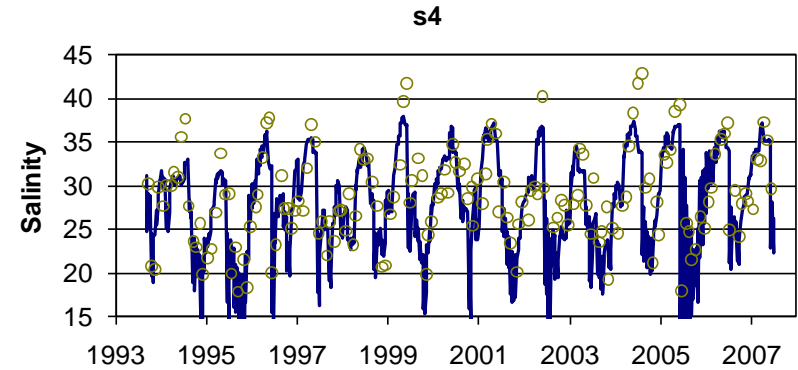

Stations for Barnes Sound and Manatee Bay not shown.

# Evaporation

# Step 1: Calibrate Salinity, Estimate Exchange Flux

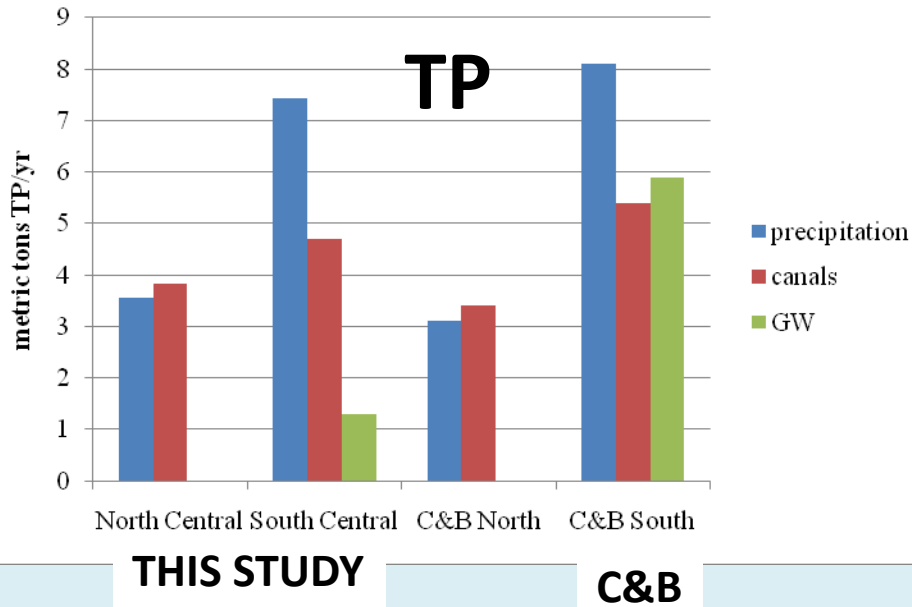

# Nutrient Loads

- Focusing on loads to nearshore basins and NO<sub>x</sub>
- North Central Inshore (NCI) – predominately urban and built-out
- South Central Inshore (SCI) – mostly active agriculture (high fertilization) with encroaching urban

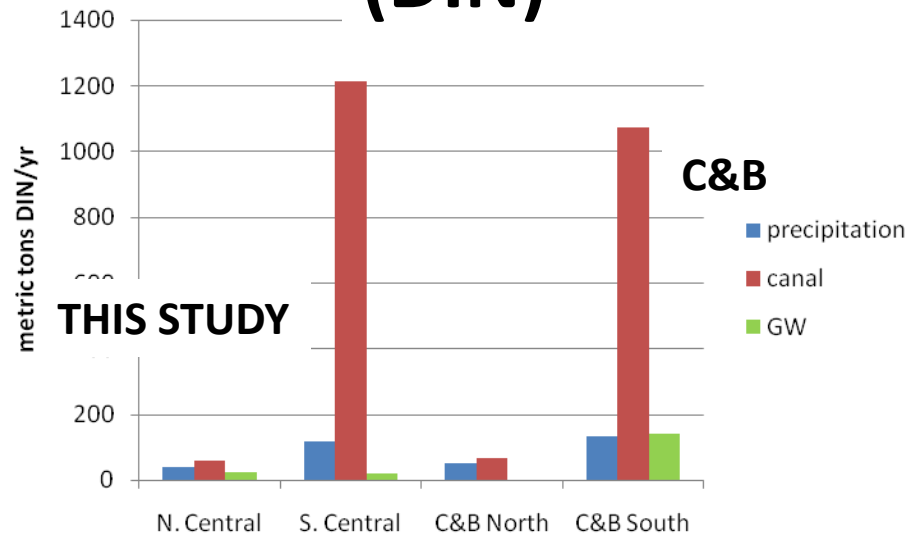

# Compare Loads to Caccia and Boyer (2007)

Note: Boxes differ in size between studies but are similar

## Dis. Inorganic N (DIN)

# Nutrient Loading Simulations

- Tot. Phosphorous
  - Base Case
  - No Load
  - 2X Load
- NO<sub>x</sub>\*
  - Base Case
  - Atmospheric Load minus 45%
  - Post Development Loads
- DIN
  - Base Case
  - Calibrated Denitrification Rate
  - Post Development Loads

**\* Only NO<sub>x</sub> discussed today at INTECOL**

The case of the missing NO<sub>x</sub>...

# Hypotheses

- The model is wrong
- Base case NO<sub>x</sub> estimated loads too high
- Measured NO<sub>x</sub> box-averaged concentrations too low
- Assumed rate of denitrification/transformation of N is too low
- Biological uptake of N (macroalgae, epiphytes)
- Circulation patterns wash nutrients out of Bay

Biscayne Bay  
Simulation  
Model  
Wang, Luo,  
Ault (2003)

## *Biscayne Bay*

# Symptoms of Eutrophication

- Low dissolved oxygen
- Decreased clarity
- Increased chlorophyll a concentrations
- Phytoplankton blooms (nuisance or toxic)
- Problematic epiphyte growth
- Problematic macroalgae growth
- Submerged aquatic vegetation (SAV) community change or loss
- Emergent or shoreline vegetation community changes or loss
- Coral or hardbottom community changes or loss
- Fish kills

# Summary

- Time-varying nutrient loads to Biscayne Bay have been developed
- Some uncertainty in some water budget loads, ex. GW
- Nothing new in loads – elevated NO<sub>x</sub> loads in South Central due to ag, elevated NH<sub>x</sub> in North Central due to urban; DIN dominated by high No<sub>x</sub>

# Summary

- Mass balance calculations have been implemented for Biscayne Bay hydrology/salinity box model
- Nutrient box model was able to simulate response of the Bay to various scenarios of nutrient loads

# Summary

- High NO<sub>x</sub> from South Central canals not showing up in water quality data – several hypotheses for reason
- Box model shows promise for continued study of Biscayne Bay nutrients

# Thanks!
