

**Inverse correlation between trabecular bone volume and  
bone marrow adipose tissue in rats treated with  
osteoanabolic agents**

Authors: Samantha Costa,

# Conflicts of Interest and Funding

The authors have no conflicts of interests to declare

**Disclosure summary:** Amgen Inc. and UCB Pharma funded the original study of Ominsky et al. 2015

**Ominsky et al. 2015 provided the histology slides for this study.**

## **Funding:**

- COBRE in Metabolic Networks- P20GM121301, NIH P30 GM106391, and U54GM115516
- American Cancer Society Research Grant #IRG-16-191-33,
- NIH/NIDDK R24 DK092759-01
- Harvard's Skeletal Phenotyping Core NIH/NIAMS P30 AR066261
- Start-up funds from the Maine Medical Center Research Institute.

# Outline

1. Background
2. Method Development: ImageJ Bone and BMAT Quantification
3. Effects of Sclerostin Antibody (Scl-Ab) and Human Parathyroid Hormone (hPTH) on bone and BMAT

# Background-Original Experimental Design

**Hypothesis: Scl-Ab and hPTH treatments would decrease overall adiposity and induce a negative correlation between BMAT and trabecular bone.**

Cohort 1:  
Pre-determined  
endpoint

Cohort 2:  
Pre-determined  
endpoint

# Increasing Trabecular Bone results in decreasing adiposity

# Increasing Trabecular Bone results in decreasing adiposity

# Increasing Trabecular Bone results in decreasing adiposity

# Increasing Trabecular Bone results in decreasing adiposity

# Bone-Independent Adiposity Analysis

Tissue Area (T.Ar) = Trabecular Bone Area (Tb. B.Ar) + Marrow Area (Ma.Ar)

Marrow Area (Ma.Ar) = Tissue Area (T.Ar) - Trabecular Bone Area (Tb. B.Ar)

# Methods Development

1. Developed ImageJ pipeline to test Scl-Ab and hPTH treatments effect on adiposity **(adiposity/tissue area, or adiposity/marrow area)** and bone.
2. Optimized parameters for adipocyte and trabecular bone quantification.

# Adipocyte Quantification Method

# Trabecular Bone Quantification Method

$$T.Ar = Tb. B.Ar + Ma.Ar$$

$$Ma.Ar = T.Ar - Tb. B.Ar$$

# Scl-Ab and hPTH caused no inverse correlation between Ma.Ar adiposity and B.Ar after 26 weeks

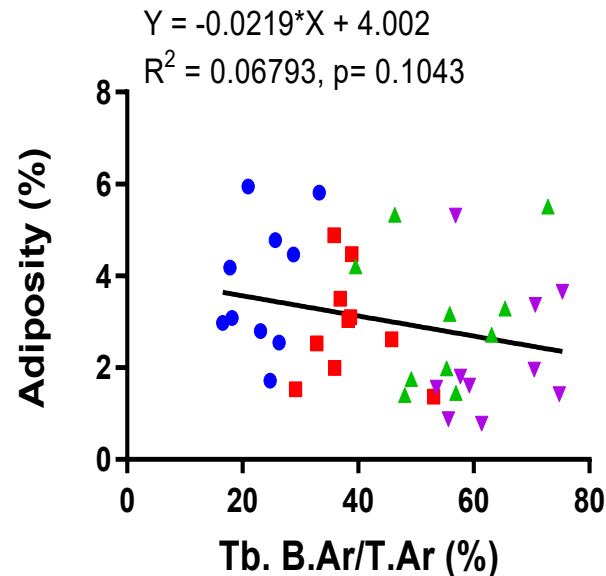

● Vehicle    ■ Scl-Ab 3 mg/kg    ▲ Scl-Ab 50 mg/kg    ▼ hPTH 75 µg/kg/d

Male

Tissue Area

Marrow Area

Collectively, the osteoanabolic treatments showed a significant inverse correlations in the tissue area in the males after 26 weeks

No inverse correlations within the marrow area were established at this time point

# Osteoanabolic agents decreased T.Ar Adiposity more significantly than Ma.Ar after 26 weeks

Male

hPTH significantly decreased Ma.Ar adiposity after 26 weeks.

\*p<0.05 vs. Vehicle; <sup>h</sup>p<0.05 vs. hPTH; <sup>T</sup>p<0.05, 4-week vs. 26-week; <sup>A</sup>p<0.05 Scl-Ab (3 mg/kg) vs. Scl-Ab (50 mg/kg). Data is shown as mean ± S.E.M. All analyses were performed as 2-way ANOVA + Tukey's/Sidak's multiple comparison tests.

# hPTH decreased adipocyte number, but not size, in the Ma.Ar

Marrow Area  
Male

\*p<0.05 vs. Vehicle; <sup>h</sup>p<0.05 vs. hPTH; <sup>T</sup>p<0.05, 4-week vs. 26-week; <sup>A</sup>p<0.05 Scl-Ab (3 mg/kg) vs. Scl-Ab (50 mg/kg). Data is shown as mean ± S.E.M. All analyses were performed as 2-way ANOVA + Tukey's/Sidak's multiple comparison tests.

# Conclusion

1. Bone marrow adiposity quantification depends on if adipose tissue is normalized to T.Ar or Ma.Ar
2. Chronic Scl-Ab and hPTH caused a significant inverse correlation between tissue area adiposity and trabecular bone area
3. Ma.Ar adiposity was decreased by trabecular bone accrual only after chronic treatments with hPTH in males
4. The ImageJ platform designed and used here is useful for histology quantification
  - multiple stains- H&E, Von Kossa tetrachrome, Trichrome
  - bone marrow adipose
  - trabecular bone
  - cortical bone
  - white adipose tissue
