

Measuring Economic Benefits of Restoration for Spatial Targeting and Ecosystem Service Trades

Lisa A. Wainger
University of Maryland
Center for Environmental Science
August 3, 2011

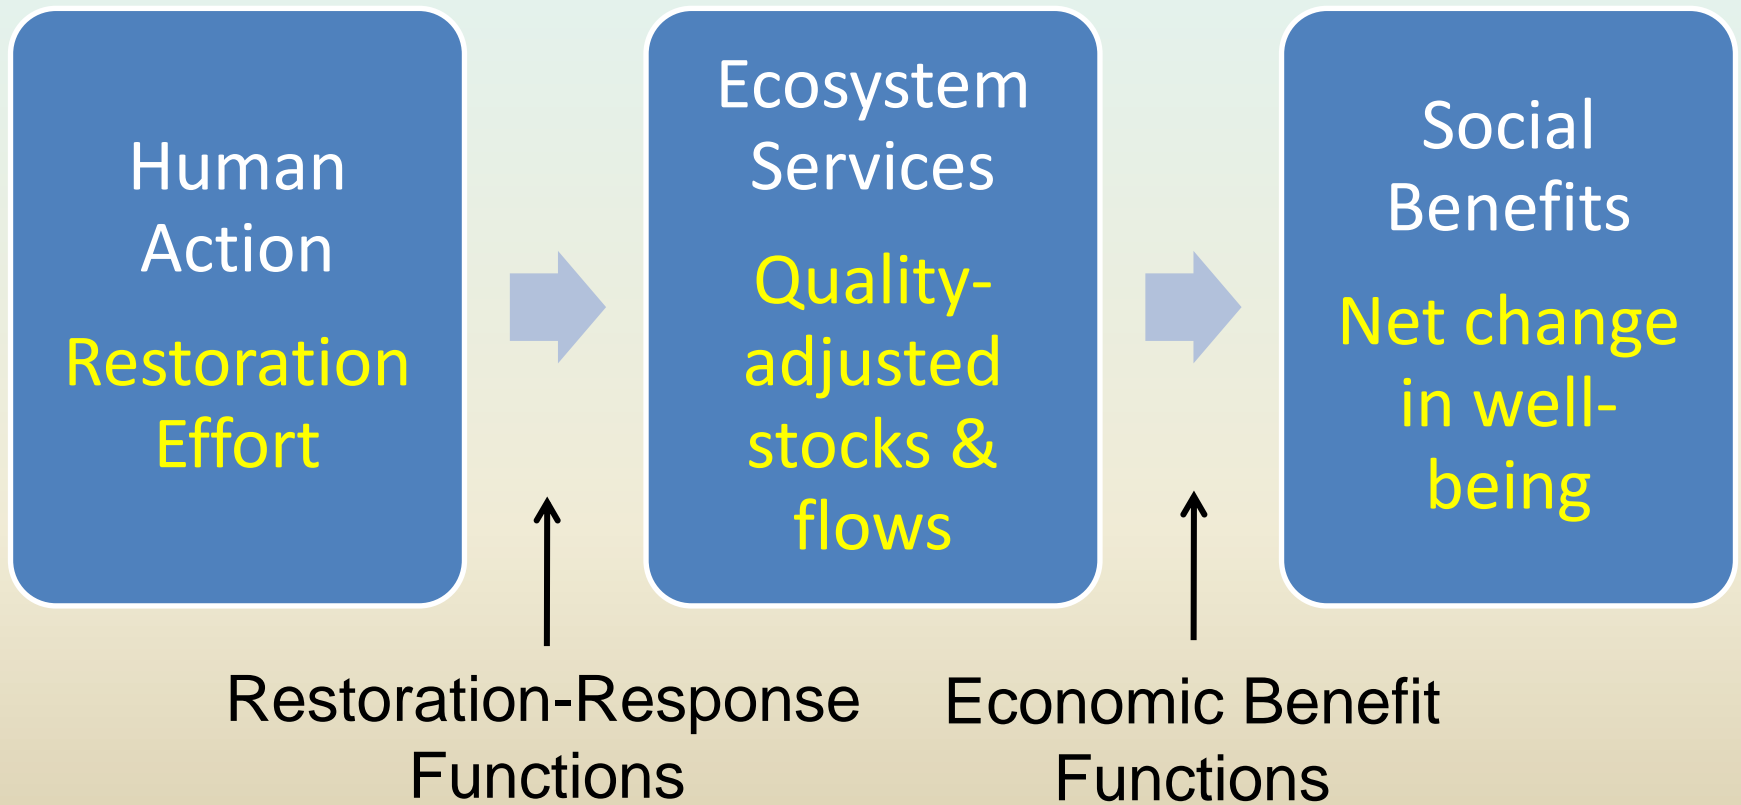

The Geography of Social Welfare from Ecosystem Services

1. How do net benefits vary spatially?
 - Which ecosystem services are affected?
 - How much is each service user affected?
 - How many people gain or lose?
 - How do practice costs & effectiveness vary?
2. Are vulnerable populations treated equitably?
3. Are public and private interests balanced?

Linking Restoration Actions to Social Benefits

Spatial Economic Decision Support (SEDS) Tool

The screenshot displays the SEDS tool interface. At the top, a blue header bar contains the University of Maryland Center for Environmental Science logo and the text "SEDS Spatial Economic Decision Support". To the right of the header are navigation icons and links for "About" and "Credits". Below the header is a map showing a region with various roads and geographical features. A configuration window titled "Spatial Economic Decision Support" is overlaid on the map. The window has three tabs: "Welcome", "Park-Wide Settings", and "Analysis". The "Welcome" tab is active, displaying instructions: "Set Global settings using the 'Sliders' as desired.", "Select/Enter the remaining information as desired.", and "When done, click the 'Next' button." Below the instructions is a "Next" button. The right side of the window contains a list of settings, each with a slider and a numerical value:

- Global Propagule Pressure - Trees: 50
- Global Propagule Pressure - Shrubs: 50
- Global Propagule Pressure - Woody Vines: 50
- Global Propagule Pressure - Herb Vines: 50
- Global Propagule Pressure - Forbs/Grasses: 50
- Ecological Significance: 50
- Cultural Significance: 50
- Proportion (%) of Invasible: 100

On the right side of the configuration window, there are input fields for:

- Enter your budget: 60000
- Select a park: Antietam
- Planning Horizon (enter 1 or 20 years): 20
- Years to Max (enter 1-50 years): 40
- Field Crew Mileage (enter miles): 50
- Field Crew Travel Time (enter hour): 1

Major Goals of the SEDS Tool

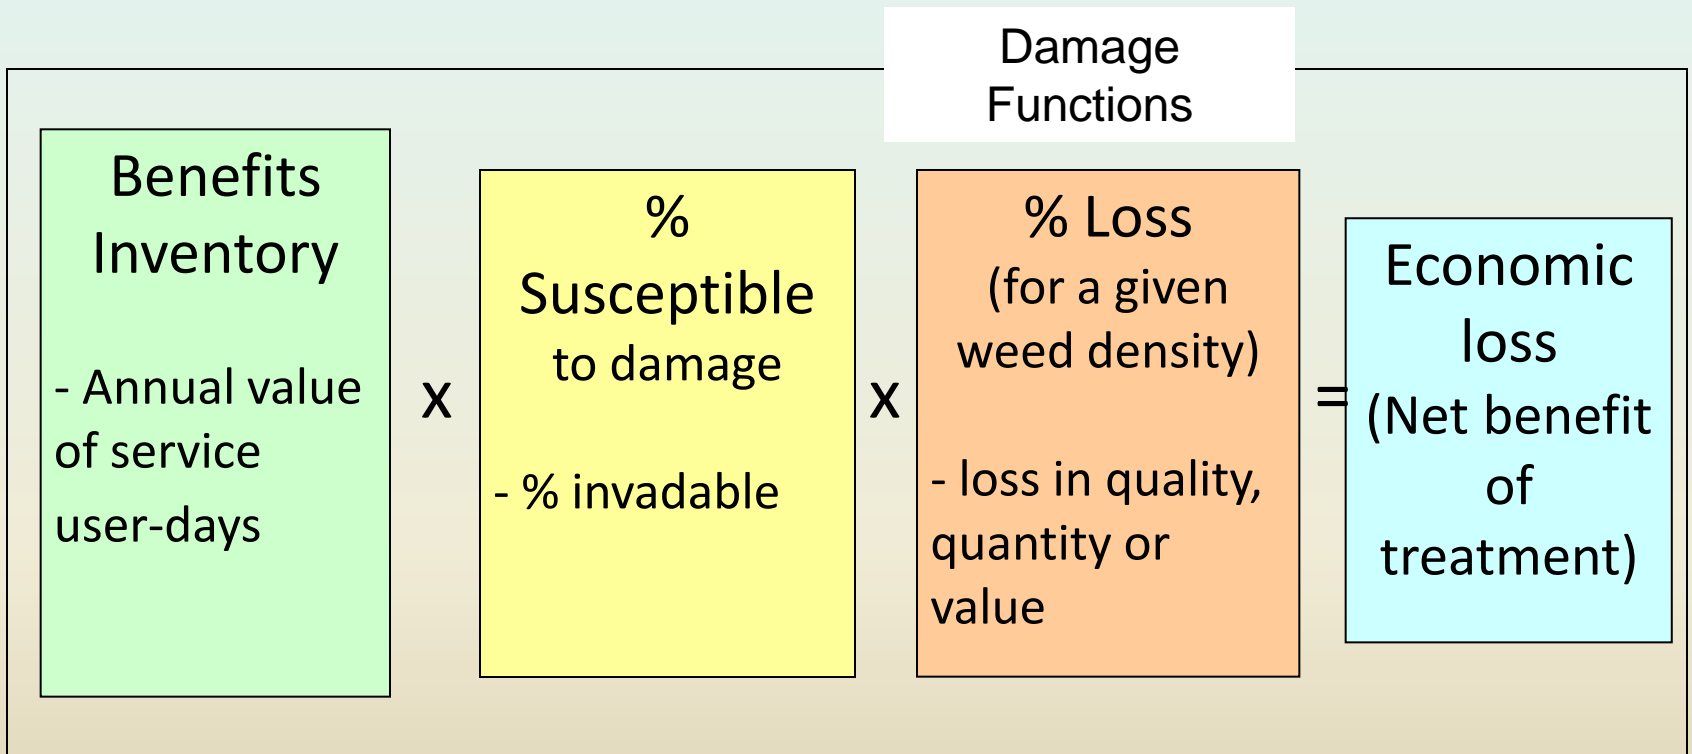

1. Support selection of sites and treatment options to manage invasive species
2. Evaluate economic benefits of management options in terms of ecosystem service changes

Cooperative Agreement with National Park Service National Capital Region

Quantify Benefits of a Restoration Action

Benefits = Damage Costs Avoided

Benefits Inventory Step 1

Which “users” are affected and how sensitive are they to environmental change?

Casual Visitors
Aesthetics of visitor experience
Boating Opportunities
Walking, Hiking, Biking Opportunities
Safety of Outdoor Recreation
Avid Recreationists
Birdwatching
Native plant/wildflower viewing
Insect watching (e.g., butterflies)
Amphibian / reptile watching
Nature photography
Historic / cultural experiences
Students & Researchers
Educational and research opportunities

Through Travelers & Neighbors
Safety & convenience of travel
Aesthetics from roads & viewpoints
Property values
Buffer incompatible uses
Reduce maintenance costs
Businesses
Agricultural production
Other Non-Proximal
Climate Regulation
Native ecosystem preservation
Charismatic species preservation
Maintain significant natural areas
Maintain historic structures and character

Benefits Inventory Step 2

Quantify quality and substitutability of service flows

1. Quality / Attractiveness

- Do site features enhance the user experience?

2. Landscape Enhancements

- Does adjacency or connectivity affect potential benefits?

3. Substitutability & Rarity

- Are local substitutes available?
- Is site irreplaceable?

Mapping Service Quality

Wildlife Viewing

Attractiveness

- Vegetation Diversity
- Miles of Stream Adjacent to Trail

Connectivity

- Connected to Green Infrastructure Corridor

Rarity

- # Rare Plants; Only park occurrence

Gower Distance Metric

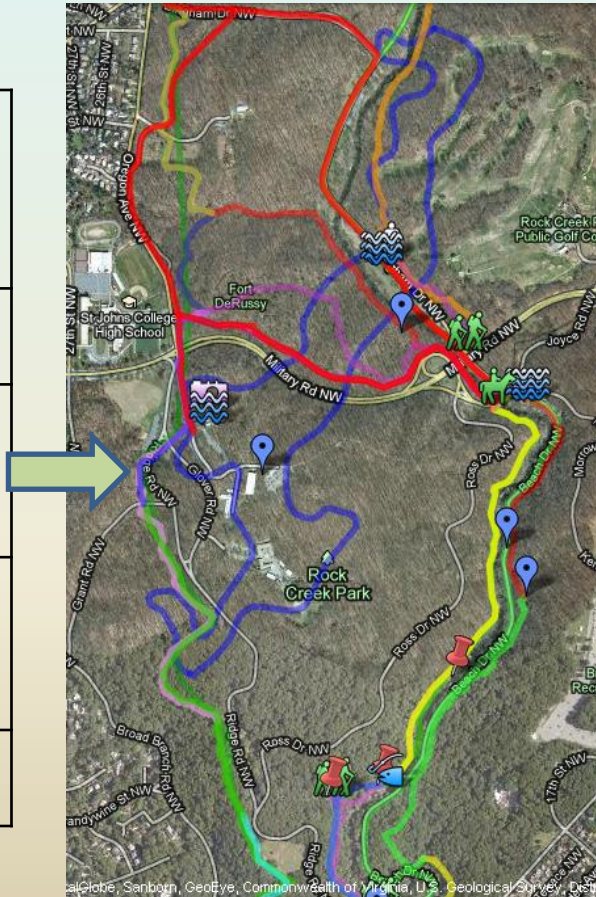

Wildlife Viewing Quality Metric

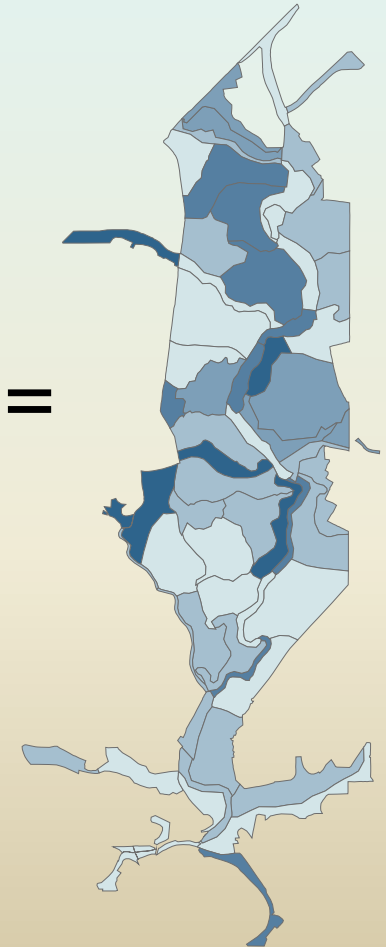

Benefits Inventory Step 3

Map Spatial Demand Based on Accessibility & Popularity

Service	# Visitors (2009)
Trail Use	247,500
Wildlife Viewing	146,250
Historical/Cultural	67,500
Road Use	10,500,000

Wildlife Viewers

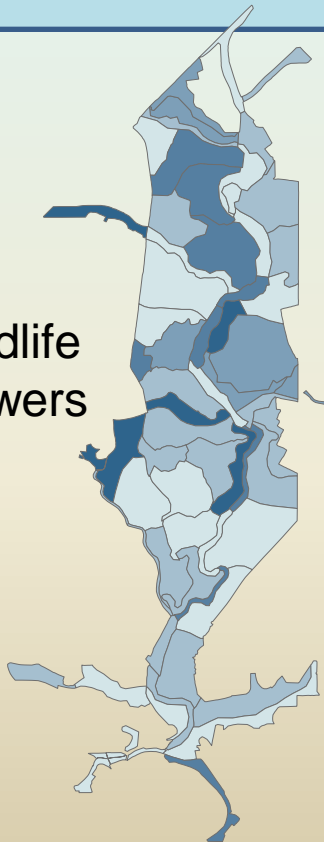

Benefits Inventory Step 4

Value Ecosystem Services by Location using Spatial Benefit Transfer

$$\text{Spatial Demand (user days)} * \left(\begin{array}{l} \text{Relative Quality} \\ \text{Metric} \end{array} \right) \propto \text{Mean consumer surplus per visit} = \$ \text{ Value (no weeds)}$$

Wildlife Viewers

*

\propto

Literature value (\$ /user day)

=

Inventory Results: Location-specific benefit measures that capture ecological quality, desirability and rarity

Damage Functions

Trail Recreation - Aesthetics and Safety
Trees

Existence Value
Shrubs

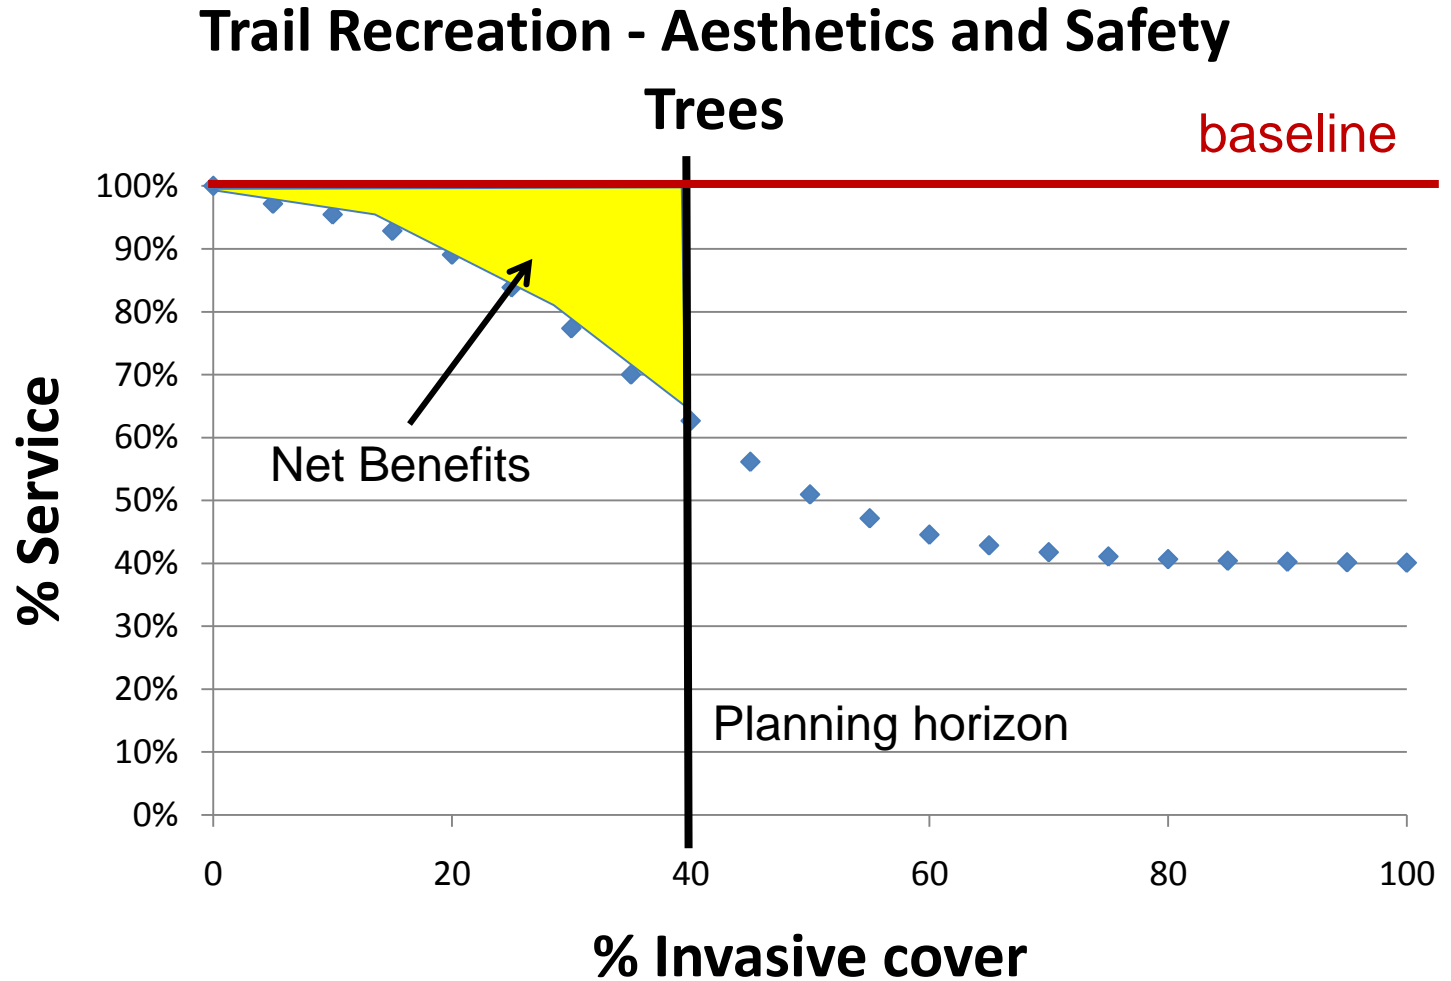

Trail Recreation - Aesthetics and Safety
Woody vines

Existence Value
Grasses / Forbs

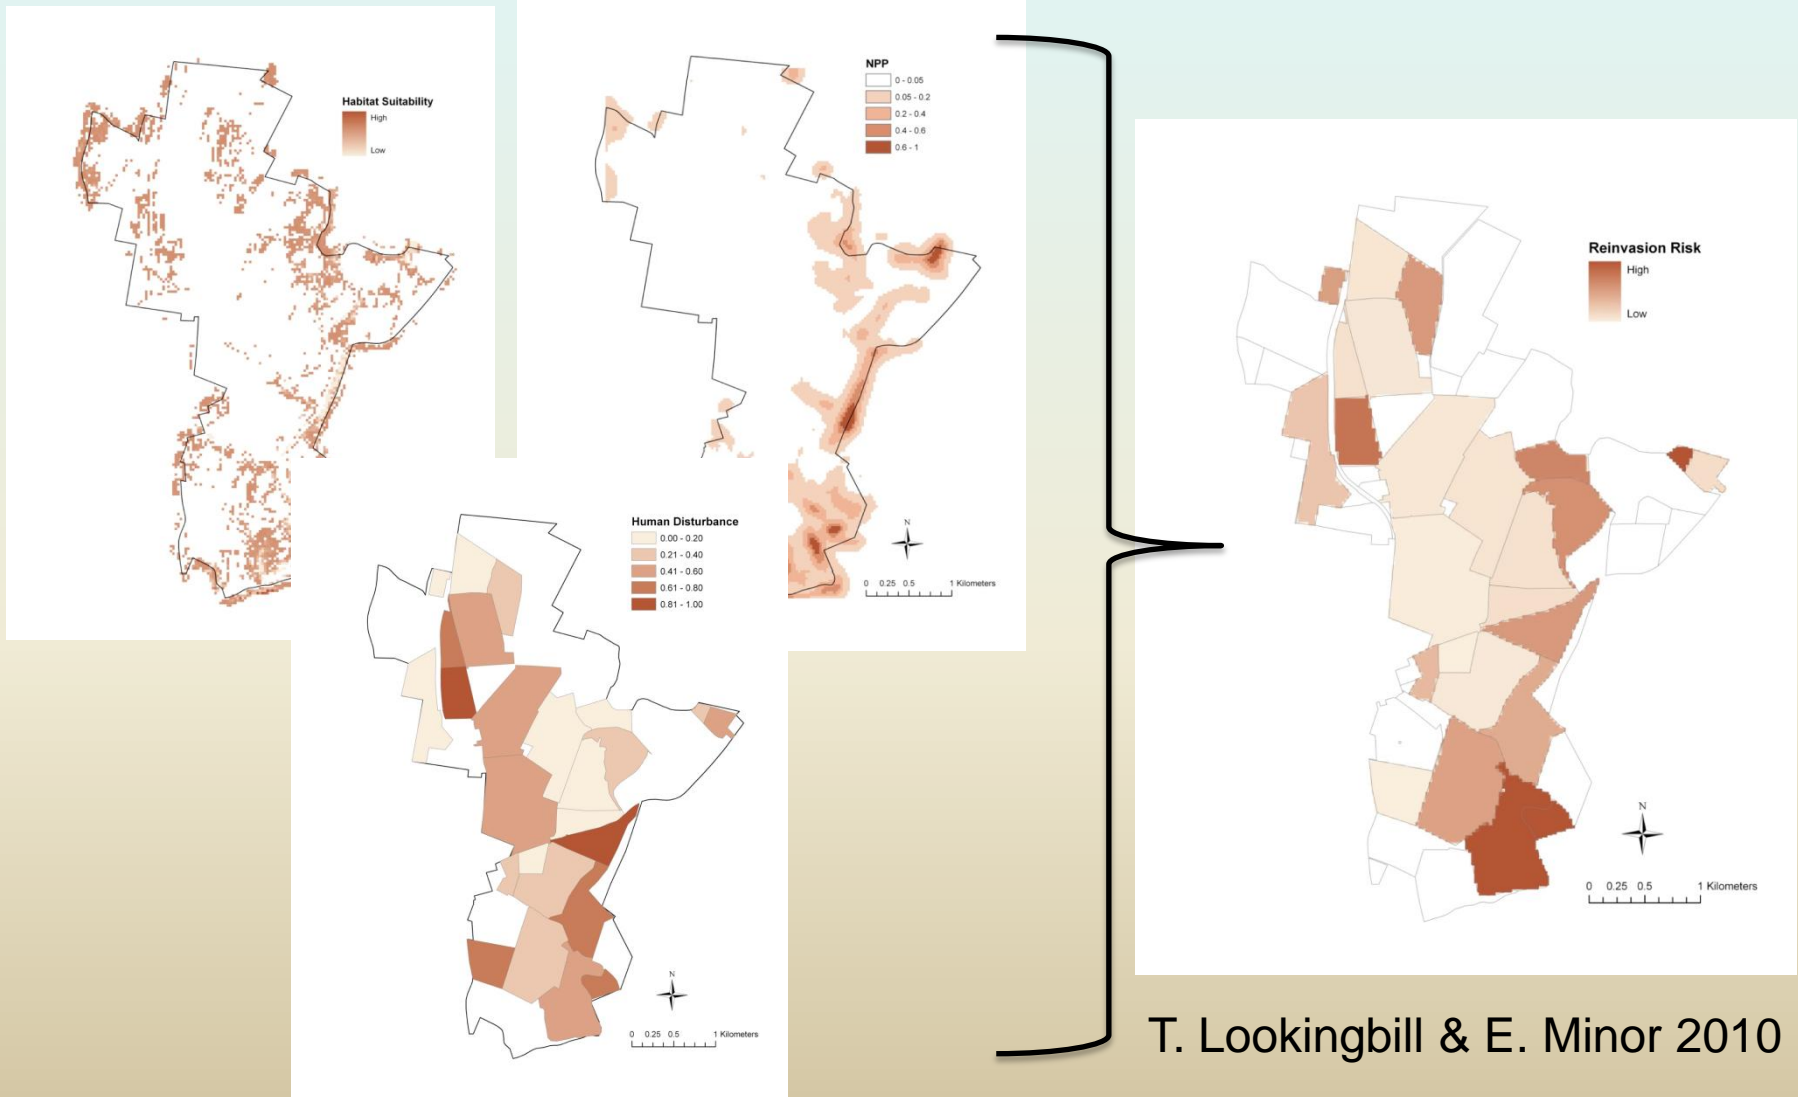

Net Benefits of Restoration Step1

Net Benefits Step 2 – Risk Adjustments

Treatment Risk = Probability that Species Will Reappear

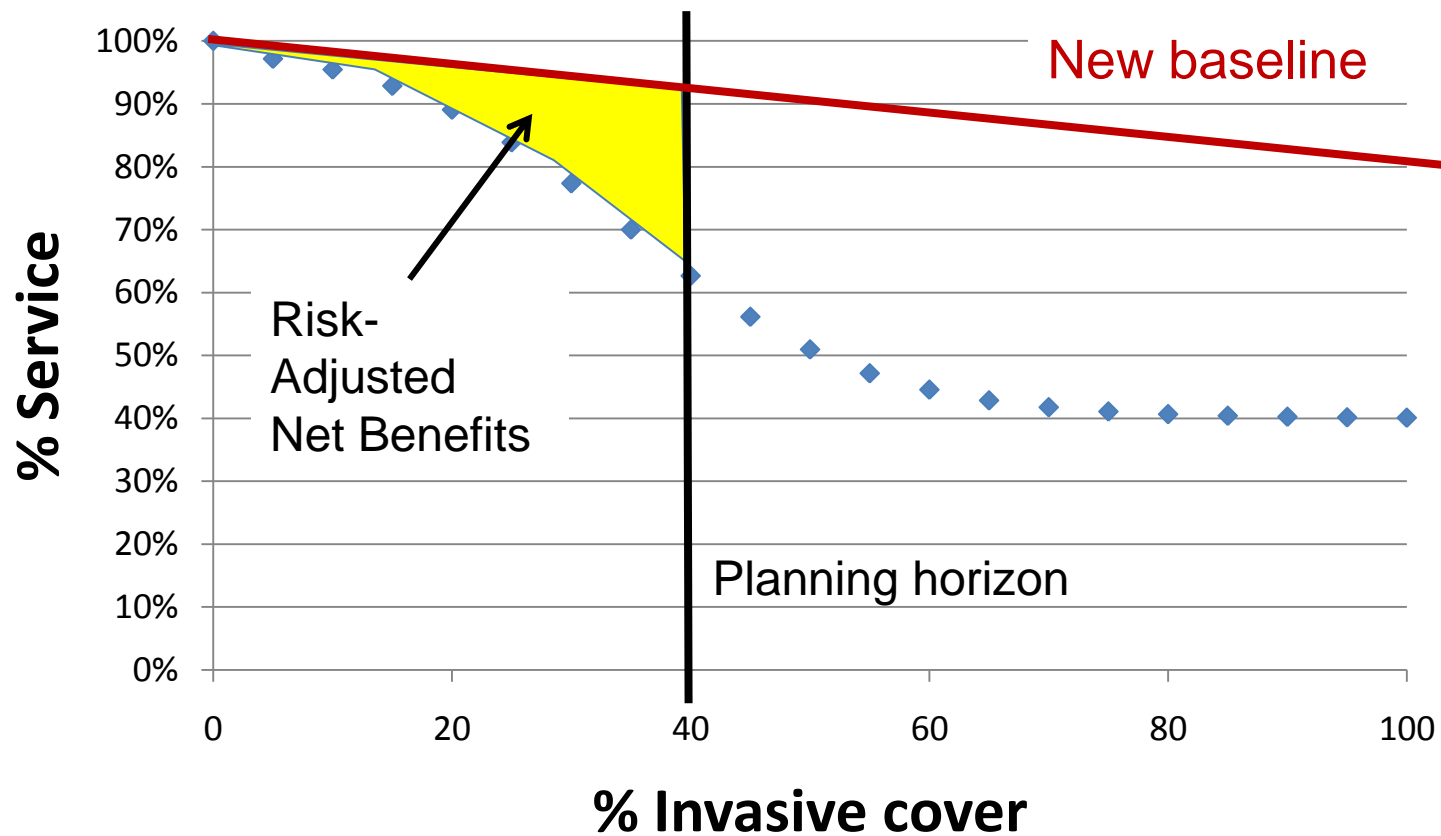

T. Lookingbill & E. Minor 2010

Risk-Adjusted Benefits

Treatment Risk Is a Deflator on Benefits

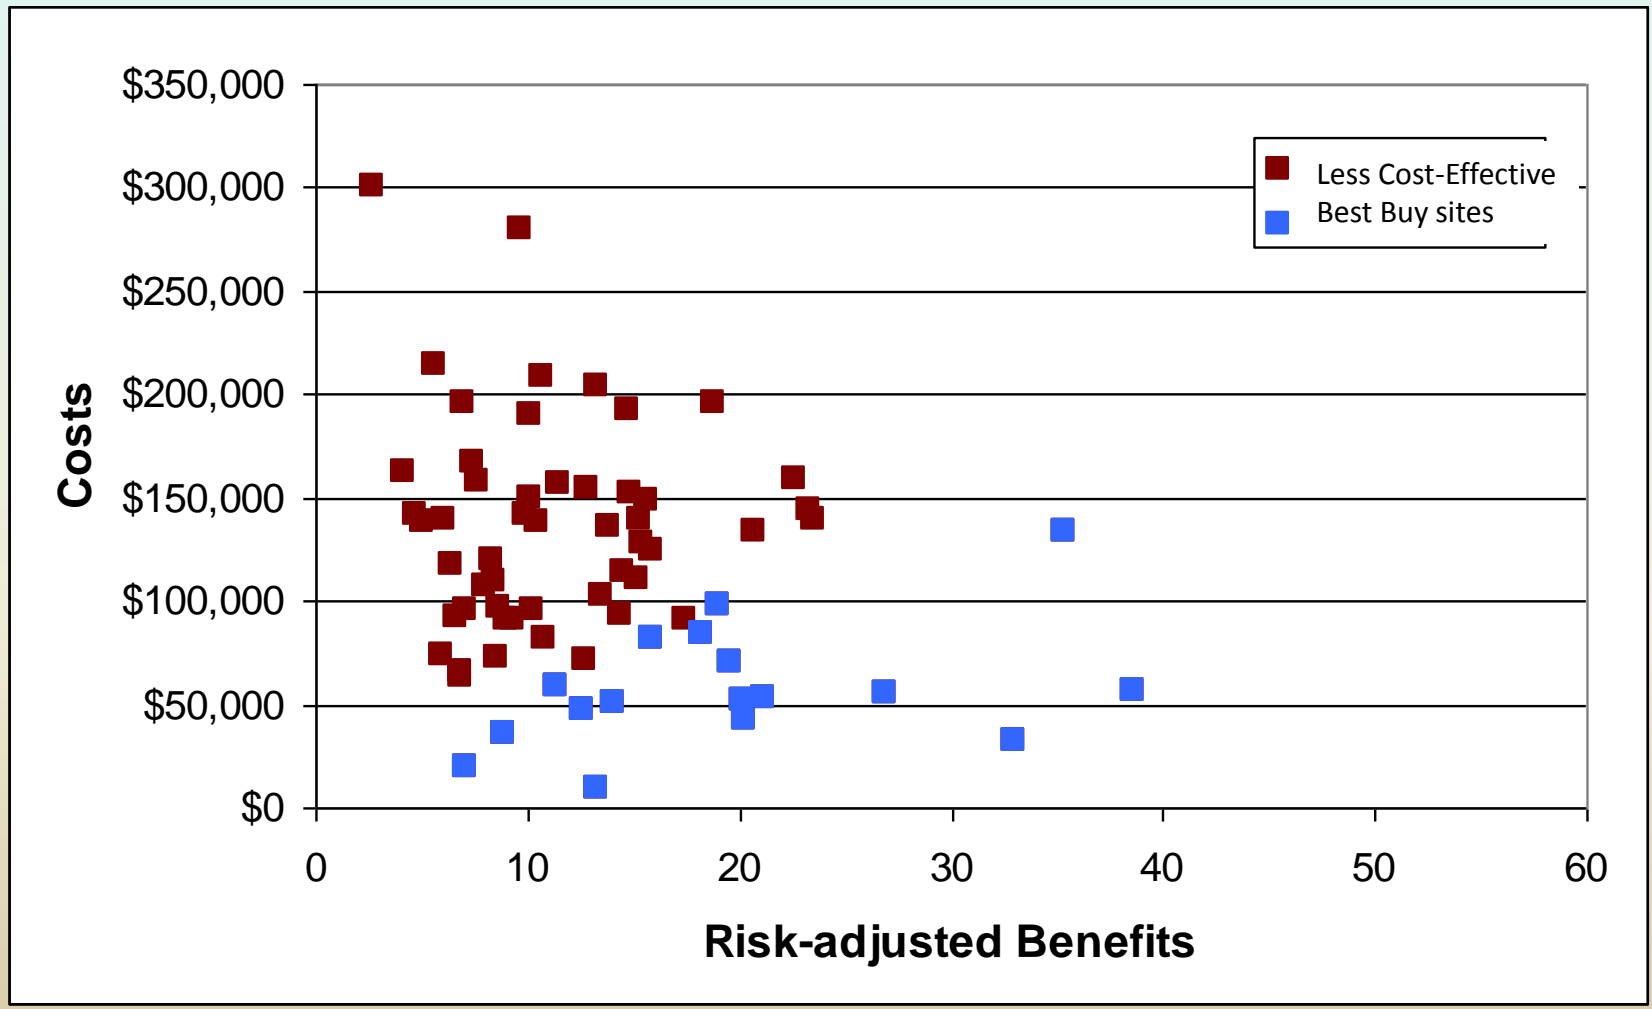

Trail Recreation - Aesthetics and Safety

Trees

Costs vs. Risk-Adjusted Benefits

Allow Selection of Cost-Effective Restoration

Novel Elements of Spatial Economic Decision Support Tool

1. ***Spatial benefit transfer*** used to value ecosystem services in ways that are sensitive to ecological qualities
2. ***Damage functions*** translate loss of ecological qualities into changes in well-being
3. ***Treatment costs*** are estimated from extensive databases and reflect site characteristics
4. ***Risk-adjusted benefits*** reflect spatial variability of practice effectiveness
5. Can be applied to targeting restoration and evaluating equivalency of trades/offset in terms of ecosystem service changes
