

Systematic Review of Ecosystem Services from Green Space

KATHERINE VON STACKELBERG

E RISK SCIENCES (KVON@ERISKSCIENCES.COM)

JOHN HEINZE

ENVIRONMENTAL HEALTH RESEARCH FOUNDATION

Summary and Highlights

- Green space provides important environmental services, especially in increasingly urbanized areas.
- Environmental disservices also exist relative to maintaining environmentally-beneficial green space.
- The challenge for policymakers and urban planners is to balance ecosystem services and disservices in a manner that maximizes the net ecosystem services associated with well-maintained green space.

Ecosystem Services as a Guiding Principle

Turf Grass Characteristics

- 80% of US population lives in an urban area (USGS, UDR, 2000)
- Turfgrass = 16 – 20 million hectares
- 80 million single family homes with 0.08 hectare average lawn size
- Small parks, triangles, urban green spaces
- Net ecosystem service flows

Estimates of turf grass area by state in km ²			
	Mean	Upper 95%CI	Lower 95%CI
Alabama	3,130	3,741	2,520
Arizona	2,559	3,178	1,941
Arkansas	2,098	2,519	1,679
California	11,159	13,890	8,434
Colorado	2,478	3,047	1,910

The Environmental Benefits of Turfgrass and Their Impact On The Greenhouse Effect

The strategic use of turfgrass is the most sensible and economically feasible approach to countering the greenhouse effect in urban areas.

COUPLED BIOGEOCHEMICAL CYCLES

Coupling biogeochemical cycles in urban environments: ecosystem services, green solutions, and misconceptions

David E. Pataki¹, Stephen H. Chang¹, Jennifer Claverie¹, Nancy C. Good¹, Vincent J. Vitousek¹, Richard Conner², Deborah P. Swaney³, Thomas W. Brasher⁴, and Rebecca C. Chapin⁵

Urban green space is expected to offset greenhouse gas (GHG) emissions, reduce air and water pollution, and build climate-resilient urban infrastructure. To test these claims, we measured the biogeochemical cycles of nitrogen (N) and carbon (C) in a grassland and a forest. We found that the grassland ecosystem services, including N and C sequestration, are comparable to those of the forest. Our results suggest that green space can be a viable strategy for GHG mitigation, water quality improvement, and ecosystem resilience.

Received 12 November 2007; accepted 10 February 2008

How can we increasingly reduce greenhouse gas emissions in a global city? (Pataki et al. 2007). In this paper, we explore the potential of urban green space to offset greenhouse gas emissions.

Key words: biogeochemical cycles, ecosystem services, green solutions, misconceptions, nitrogen, carbon, urban green space, GHG emissions, water quality, ecosystem resilience.

Introduction: Urban green space is expected to offset greenhouse gas (GHG) emissions, reduce air and water pollution, and build climate-resilient urban infrastructure. To test these claims, we measured the biogeochemical cycles of nitrogen (N) and carbon (C) in a grassland and a forest.

Results: We found that the grassland ecosystem services, including N and C sequestration, are comparable to those of the forest. Our results suggest that green space can be a viable strategy for GHG mitigation, water quality improvement, and ecosystem resilience.

Conclusions: Our results suggest that green space can be a viable strategy for GHG mitigation, water quality improvement, and ecosystem resilience.

Implications: Our results suggest that green space can be a viable strategy for GHG mitigation, water quality improvement, and ecosystem resilience.

Future research: Our results suggest that green space can be a viable strategy for GHG mitigation, water quality improvement, and ecosystem resilience.

Keywords: biogeochemical cycles, ecosystem services, green solutions, misconceptions, nitrogen, carbon, urban green space, GHG emissions, water quality, ecosystem resilience.

- Erosion control and runoff prevention
- Soil, water and nutrient stabilization
- Recreation and Exercise (reduced obesity)
- Water and air purification
- Temperature modification
- Oxygen generation
- Carbon sequestration
- Stress reduction
- Noise abatement
- Aesthetic value

Ecosystem Service: Turf Grass Impact On Erosion Control & Water Quality Protection

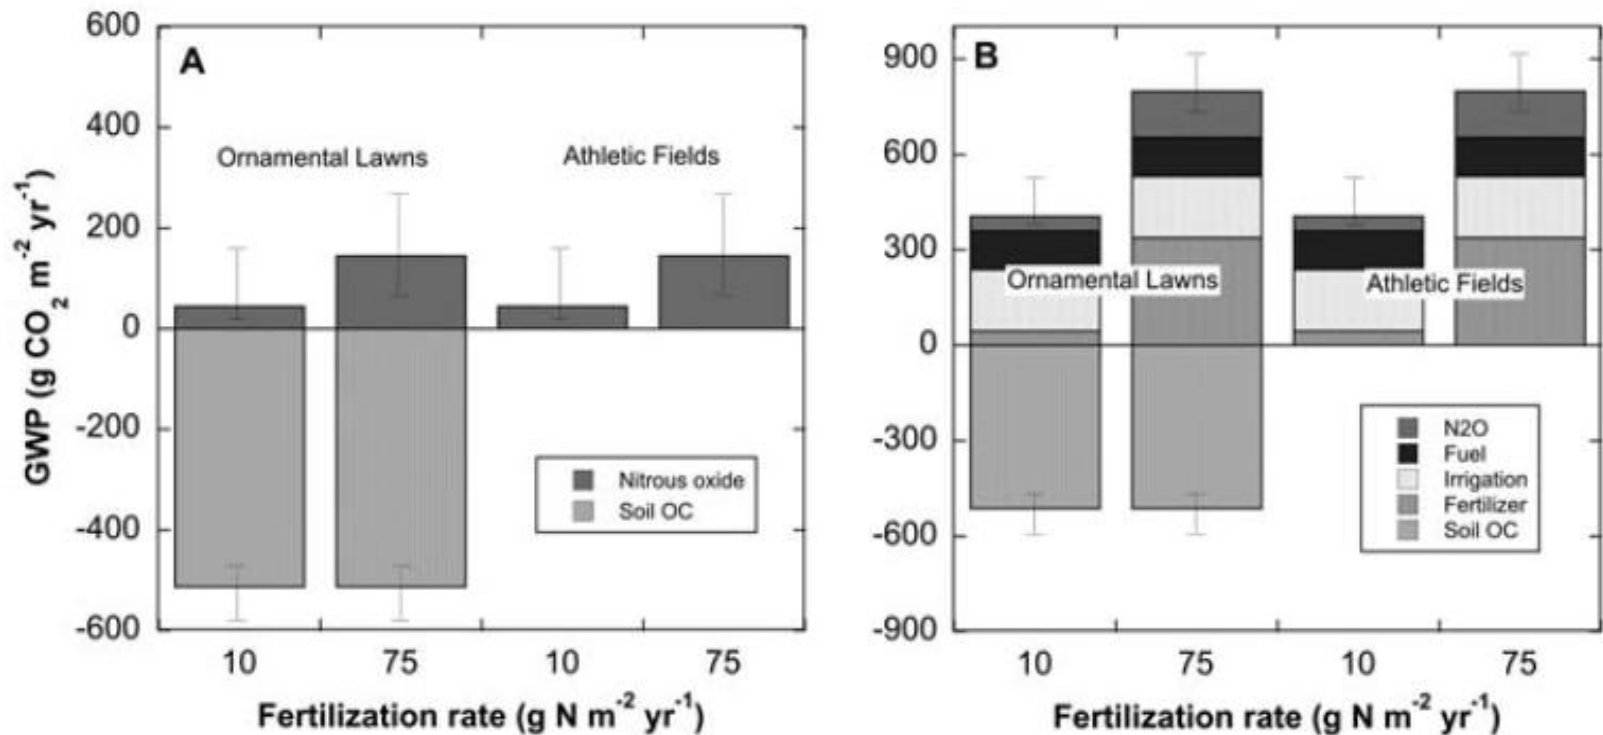

- Reduces Mass Water Flow & Run-off
 - Turf can withstand a maximum permissible velocity of around 5 ft/s with an absolute maximum of 8 ft/s. (Source: USDA 1954. Handbook of Channel Design for Soil and Water Conservation. Technical Paper TP-61.)
 - Less than 1% to 13% of total water applied as runoff (Source: Watschke TL. 1990. J Env Turfgrass 2(1):1)
 - Grass selection and density affects run-off (Source: Linde DT et al. 1999 J Turfgrass Mgmt 2(4):11-34, DOI: 10.1300/J099v02n04_02)
- Erosion reduced by 90-99% (Source: University of Florida)
 - A dense lawn is 6 times more effective than a wheat field and 4 times better than a hayfield at absorbing rainfall. (Source: http://www.michigan.gov/mda/0,%201607,7-125-1570_2476_2481-9345--,00.html, Univeristy of Florida)
 - High shoot density increases erosion control potential (Source: Beard JB and RL Green. 1994. J Env Qual)

Ecosystem Service: Temperature Control

August Temperature Comparisons			
	Maximum daily Temp deg F		Nocturnal minimum temp
Surface	Surface temp	3" above surface	Surface temp
Green, irrigated turf	88°	89°	76°
Synthetic turf, dry	158°	96°	84°
Brown, dormant turf	126°	95°	79°
Bare soil, dry	102°	91°	78°

Source: Beard, J.B., 1990. *J Env Turfgrass* 2(1): 6.

Ecosystem Service: Carbon Sequestration Potential

Ornamental urban lawns can effectively sequester CO₂ depending on management assumptions.

Source: Townsend-Small A and Czimczik. 2010. *Geophysical Research Letters*, 37:L06707, doi:10.1029/2010GL042735.

Ecosystem Service: Carbon Sequestration Potential

Table 4: US grassland annual soil organic carbon accumulation rate

	Minimal input lawns	DIY lawns	BMP lawns
	g/m ² /year		
SOC	46.0 - 127.1	46.0 - 127.1	129 - 235
Fertilizer SOC	0	78	78.0 - 98.0
Irrigation SOC	0	0.5 - 1.5	1.5 - 10.0
Gross SOC	46.0 - 127.1	124.5 - 206.6	129.0 - 235.1
Mowing HCC	12.9 - 20.6	12.9 - 20.6	12.9 - 20.6
Irrigation HCC	0	0.1 - 0.3	1.6
Fertilizer HCC	0	10.1 - 20.4	15.5 - 49.5
Pesticide HCC	0	0.4 - 2.6	0.8 - 5.6
Gross HCC	12.9 - 20.6	23.6 - 43.9	30.8 - 77.3
Total net sequestration	25.4 - 114.2	80.6 - 183.0	51.7 - 204.3
SOC = soil organic carbon; HCC = hidden carbon cost			

Source: Zirkle G, Rattan L and B Augustin. 2011. Modeling carbon sequestration in home lawns. Horticultural Science 46(5):808–814.

- Rate of soil organic carbon sequestered in home lawns is 0.5 to 1.5 Mg C/ha/year
- Greater than rate for U.S. cropland of 0.3 Mg C/ha/ year (Lal and Follett 2009)
- Bruce et al. (1999) predicted 0.6 to 1.9 Mg C/ha/year for worlds grasslands.

Ecosystem Service: Impacts on Human Health

- Obesity a significant public health issue
- Body mass index of children shows an inverse relationship to exposure to green space *(Source: Bell 2008; Pataki 2011)*
- Important psychological impacts (general well-being) *(Source: Mitchell R and F Popham. 2008. Lancet 372:1655–60.)*
- Reduce socioeconomic inequalities *(Source: Mitchell R and F Popham. 2008. Lancet 372:1655–60.)*

Not All Green Space Has the Same Value

Ecosystem Service: Maintained Green Space Reflects “Green Value”

- Real property values
- Donations to conservation/easement
- Use fee
- Inclusion in redevelopments
- Average household WTP in Holland ranged from 401 to 1455 Euro for a one percent increase of parks and public gardens in a 500 meter circle around the house. *(Source: Rouwendall J and J van der Straaten. 2008.)*

Green Space Ecosystem Services & Disservices

ECOSYSTEM SERVICES

1. Erosion control and runoff prevention
2. Soil, water and nutrient stabilization
3. Recreation and Exercise (reduced obesity)
4. Water and air purification
5. Temperature modification
6. Oxygen generation
7. Carbon sequestration
8. Stress reduction
9. Noise abatement
10. Aesthetic value

ECOSYSTEM DISSERVICES

1. Fertilizer use/runoff (hardscape or impervious surfaces)
2. Potential health effects (improper use)
3. Potential environmental effects (improper use)
4. Carbon use
5. Energy usage
6. Water usage

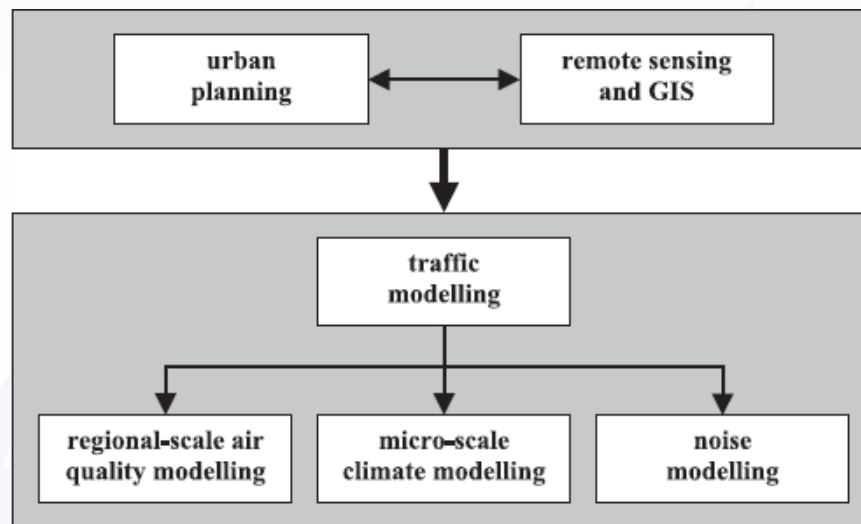

Modeling Urban Characteristics Relative to Ecosystem Services

- Five UK cities
- Demographic characteristics
- Biodiversity potential
- Runoff from typical storm events
- Carbon sequestration potential
- Temperature
- Conclude that patchy green space provides greater services than impervious surfaces and housing

Source: Tratalos J, Fuller RA, Warren PH, Davies RG and KJ Gaston. 2007. Urban form, biodiversity potential and ecosystem services. *Landscape and Urban Planning* 83:308–317.

Ongoing European Research Project

- Benefits of Urban Green Space (BUGS) is a methodology to assess the impact of green space and settlement patterns on urban environmental quality and social well-being and to formulate recommendations regarding the use of green space as a design tool in urban planning strategies. www.vito.be/bugs

Source: De Ridder K, Adamec V, Banuelos A, Bruse M, Bürger M, Damsgaard O, Dufek J, Hirsch J, Lefebvre F, Perez-Lacorzana JM, Thierry A and C Weber. 2004. An integrated methodology to assess the benefits of urban green space. *Sci Tot Env* 334– 335:489–497.

Integrated Analyses

- Biome-BGC ecosystem process model
- Models warm-season and cool-season turf grasses under different management scenarios
- Simulates potential carbon and water fluxes assuming well-maintained lawn management practices across several US locations
- Results indicate that well-watered and fertilized turf grasses act as a carbon sink but with a water cost.

Source: Milesi C, Running SW, Elvidge CD, Dietz JB, Tuttle BT and RR Nemani. 2005. Mapping and modeling the biogeochemical cycling of turfgrasses in the United States. *Environ Manag* 36:426-438. DOI: 10.1007/s00267-004-0316-2.

More Integrated Analyses

Table 1. Commonly discussed urban ecosystem services/disservices associated with biogeochemical cycles, with their potential magnitudes (relative to the scope of the associated environmental problem) and uncertainty levels

Ecosystem service	Potential magnitude	Current level of uncertainty
C sequestration	Low	Low
Net GHG emissions	Moderate	High
Local cooling	High	Moderate
Stormwater mitigation	High	Moderate
Water-quality mitigation	High	High
Air-quality mitigation	Low	High
General human health	Moderate	Moderate

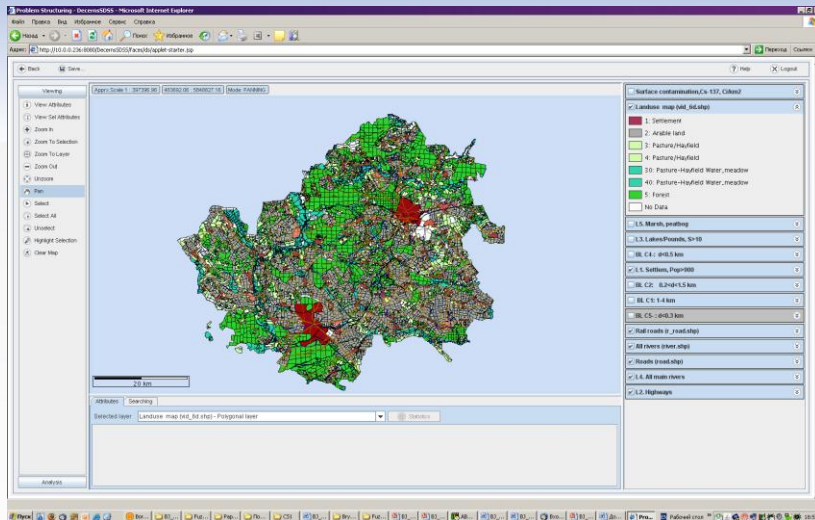

Ecosystem disservice	Potential magnitude	Current level of uncertainty
Water use	High	Moderate
Net GHG emissions	Moderate	High
Source of allergens	High	Low
VOC emissions	Moderate	Moderate

Notes: GHG emissions are listed as both a service and disservice because the impacts of plants or soils may be either positive (net cooling) or negative (net warming) in hot climates. VOC = volatile organic compounds, which are precursors to the formation of ozone pollution.

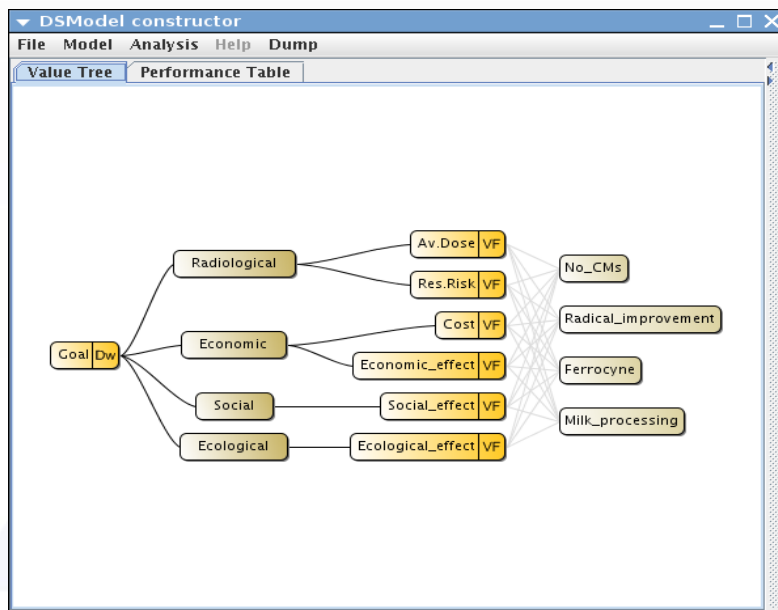

Source: Pataki DE, Carreiro MM, Cherrier J, Grulke NE, Jennings V, Pincetl S, Pouyat RV, Whitlow TH and WC Zipperer. 2011. Coupling biogeochemical cycles in urban environments: ecosystem services, green solutions, and misconceptions. *Front Ecol Environ* 9(1):27–36, doi:10.1890/090220.

- Discuss services and disservices in urban environments
- Urban area and ecosystem specific
 - Arid areas
 - Population density
- Clearly articulate potential benefits

Spatial Decision Support

- Formalized methods for evaluating alternatives against criteria to identify tradeoffs
- Link GIS, environmental models, and decision criteria and objectives
- Scenario development
 - Stakeholder involvement
 - Establishing criteria

Potential Strategies To Maximize Services

- Minimize run-off and product deposition on hardscapes and support development of best management practices
- Encourage blended landscapes that feature lawns, rain gardens, shrubs, trees and green ground cover
- Changes in irrigation practices (e.g., use of rain collection, recycling wastewater)
- Educate consumers

Conclusions

- Urbanization is increasing
- There are clear ecosystem service benefits associated with green space in urban areas
- Most beneficial green space may require additional maintenance which can lead to potential ecosystem disservices that can be managed
- GIS-based methods, integrated models, and decision analytic approaches can inform evaluation of tradeoffs
- Effective mitigation of disservices central to maximizing net environmental services
 - Solutions are needed to improve the amount and vitality of green space in urban areas
