Ecosystem Services at Superfund Sites

Ecosystem Services at Superfund Sites

Reuse and the Benefit to Community

Superfund Sites across the United States (~460 sites)

2023 Report available at: <https://semspub.epa.gov/work/HQ/100003256.pdf>

Examples of Ecosystem Services at Site Cleanup Projects

Final Ecosystem Goods and Services (FEGS) are those **components of nature** within an **environment** that are **directly enjoyed, consumed or used** to yield human well-being.

**Subsistence fishing –
Portland Harbor,
Washington State**

**Timber production – Black
Butte Mine, Oregon**

**Groundwater reclamation –
Phoenix-Goodyear Airport
Area, Arizona**

**Erosion control – Bunker
Hill Mining and
Metallurgical Complex,
Idaho**

**Pollinator habitat –
Palmerton Zinc Pile,
Pennsylvania**

**Cultural heritage – Indian
Island, California**

**Recreational fishing –
California Gulch, Colorado**

**Bird watching – Rocky Mountain
Arsenal, Colorado**

**Educational experiences – Sangamo
Electric Dump/Crab Orchard National
Wildlife Refuge, Illinois**

EPA's Ecosystem Services Tools

EPA's Ecosystem Services Tool Selection Portal

www.epa.gov/eco-research/ecosystem-services-portal

Ecosystem services assessment tools help you describe, quantify, and sustain the benefits nature offers humans and weigh the impact of decisions. This tool portal helps select the best tools for your scenario. Choose a path below to find the tools that match your needs.

I'm looking for help with...

Choose this path if you are:

- Evaluating the possible impact of environmental stressors such as chemicals, disease, or invasive species.
- Predicting the likelihood of future effects.
- Using an Ecological Risk Assessment in Remedy Decisions.
- Preparing and/or reviewing Ecological Risk Assessments.

Choose this path if you are:

- Doing a preliminary assessment or investigation of a contaminated site.
- Planning or engaged in cleanup or reuse of a contaminated site.
- Working with a Contaminated Site process or model.

Choose this path if you are:

- Working towards a goal that isn't ecological risk assessment or contaminated site cleanup (for example, natural resource management, park and recreation planning, habitat restoration, and stormwater management).
- Have a general interest in ecosystem services.

Sharpe et al. 2023. *Frontiers*. <https://doi.org/10.3389/fevo.2023.1290662>

Harwell et al. 2024. *Sustainability* <https://doi.org/10.3390/su16051739> 4

Step 1

Step 2

Step 3

Matching Tools

Example: Lake Sandy Jo Superfund Site, Gary, Indiana

- Partnership between the city of Gary, Fern Hill, the Indiana Department of Environmental Management, and the US Environmental Protection Agency
- Goal: to provide additional benefits to the community through consideration of ecosystem services
 - What does the community value?
 - How could these additional benefits be incorporated into development plans?

Community Interests

- Over the course of two virtual workshops and an in-person design charrette, community members discussed community priorities and potential benefits, including:
 - Safety and security
 - Living standards
 - Health
 - Educational opportunities
 - Recreational opportunities
 - Stormwater/flood management
 - Aesthetics
 - Air quality

Safety and security

- Lighting and emergency poles
- Greening
- Clear lines of sight
- Fencing

Air quality

- Vegetation barriers
- Trees
- Green roofs

<https://www2.purpleair.com/products/purpleair-pa-ii>

m Interstate 80/94

Water management

- Landscape features
- Surface covers
- Vegetation

Rainwater collected in planter box then channeled into rain garden
Boulder, CO

Irrigation by disconnected downspout
Denver, CO

Green roof
Salt Lake City, UT

Vegetative swale
Fort Carson, CO

Pervious pavement sidewalk
Sioux City, SD

Retention pond
Fargo, ND

Aesthetics

- Greenspace
- Trees and other vegetation choices
- Diverse plants flowering throughout the year
- Artistic Installments

Educational Opportunities

- Outdoor classrooms
- Study plots for students, researchers, & citizen scientists
- Community gardens
- Educational signage

This Photo by Unknown Author is licensed under [CC BY-SA-NC](https://creativecommons.org/licenses/by-sa/4.0/)

Recreational Opportunities

- Trails
- Bird and pollinator habitat
- Play and exercise space

Renewable energy

- Solar powered commercial buildings
- Solar lighting
- Solar array
- Wind power

Reduced urban heat island

- Decrease the amount of black impervious surfaces
- Vegetation choices
 - Big broad leafed deciduous trees
- Cool or green roofs
- Cool paving materials and permeable parking

National Ecosystem Services Classification System (NESCS+)

- NESCS Plus is an organizer.
- It aids identifying and classifying what matters directly to people.

Ecological End-Product

Urban Ecosystems → Heat Hazard Mitigation

Vegetation can contribute to a more comfortable environment on hot days. In addition to the benefits of shade that trees can provide, all vegetation cools through evapotranspiration; this process moves water through the plant, into the air. The summertime urban heat island effect occurs in many cities, when the urban areas are hotter during the day and stay warmer at night than surrounding areas. This is in part because buildings and pavement absorb solar radiation during the day and release it at night. Vegetation can both reflect and transform incoming solar radiation, so surfaces get less hot.

Measures of human comfort

Compared with unshaded areas on a hot day, areas shaded by trees had 5-7°C (9-12.6°F) lower globe temperatures (a measure of air temperature and humidity which relates well to human comfort) ([Armson et al., 2012](#)). In semi-enclosed courtyards in a hot and dry climate, shade from trees decreased daytime temperatures by up to 1.8°C (3.2°F), whereas shade provided by fabric mesh actually increased temperatures by 1°C (1.8°F) ([Shashua-Bar et al., 2009](#)). In Melbourne, Australia, street trees (70-77% tree canopy coverage) reduced

What is the EcoService Models Library (ESML)?

<https://ESML.epa.gov/>

A searchable database of ecological models for estimating the production of ecosystem goods and services.

- Detailed descriptions of **>315 ecological models (>50 individual descriptors)** – covering purpose, approach, and environmental use such as ecosystem services using NESCS Plus and CICES)
- Detailed descriptions of **ecological model variables (40 additional descriptors)**
- **Variable Relationship Diagrams**, conceptual diagrams for each model

Modeling Scenarios for LSJ Ecosystem Services Areas

1. Wildlife that may use the site (US Fish and Wildlife Service)
2. Wildflowers to attract pollinators (Williams et al. 2015)
3. Trees for air quality, energy, and stormwater (US Forest Service i-Tree)
4. Low impact development options (EPA Stormwater Calculator)
5. Education benefits of school field trips (Hutcheson et al. 2018)
6. High-level suite of ecological functions (Ecosystem Intelligence Tool)

IPaC Information for Planning and Consultation

Monarch Butterfly

Danaus plexippus

STATUS
Candidate; A species under consideration for official listing for which there is sufficient information to support listing.

DESCRIPTION
Note - the monarch is a candidate species and not yet listed or proposed for listing. Consultation with U.S. Fish and Wildlife Service under section 7 of the Endangered Species Act is not required for candidate species, like the monarch. We encourage agencies, however, to take advantage of any opportunity they may have to conserve the species.

For information on monarch conservation, visit <https://www.fws.gov/initiative/pollinators/monarchs>, http://www.mafwa.org/?page_id=2347, and for the West, <https://wafwa.org/committees-working-groups/monarch-working-group/>.

Adult monarch butterflies are large and conspicuous, with bright orange wings surrounded by a black border and covered with black veins. The black border has a double row of white spots, present on the upper side of the wings. Adult monarchs are sexually dimorphic, with males having narrower wing venation and scent patches. The bright coloring of a monarch serves as a warning to predators that eating them can be toxic.

During the breeding season, monarchs lay their eggs on their obligate milkweed host plant (primarily *Asclepias* spp.), and larvae emerge after two to five days. Larvae develop through five larval instars (intervals between molts) over a period of 9 to 18 days, feeding on milkweed and sequestering toxic chemicals (cardenolides) as a defense against predators. The larva then pupates into a chrysalis before emerging 6 to 14 days later as an adult butterfly. There are multiple generations of monarchs produced during the breeding season, with most adult butterflies living approximately two to five weeks; overwintering adults enter into reproductive diapause (suspended reproduction) and live six to nine months.

In many regions where monarchs are present, monarchs breed year-round. Individual monarchs in temperate climates, such as eastern and western North America, undergo long-distance migration, and live for an extended period of time. In the fall, in both eastern and western North America, monarchs begin migrating to their respective overwintering sites. This migration can take monarchs distances of over 3,000 km and last for over two months. In early spring

Wildflower planting mix supporting Bees in Gary, IN

(Utilizing ESML model 784, <https://esml.epa.gov/detail/em/784>, Williams et al. 2015 <https://doi.org/10.1890/14-1748.1>)

A mix to support wild bee abundance and species richness.

1. *Asclepias syriaca* - Common milkweed***
2. *Dalea purpurea* - Purple prairie clover
3. *Lupinus perennis* - Wild lupine***
4. *Monarda fistulosa* - Wild bergamot
5. *Ratibida pinnata* - Prairie coneflower
6. *Rudbeckia hirta* - Black-eyed Susan***
7. *Silphium perfoliatum* - Cup plant
8. *Solidago speciosa* - Showy goldenrod
9. *Symphotrichum leave* - Smooth blue aster
10. *Symphotrichum novae-angliae* - New England aster

*** represents species also found in the proposed seeding mix for Lake Sandy Jo

i-Tree delivers current, peer-reviewed tree benefits estimation science from the USDA Forest Service to all types of users with free tools and support.

<https://www.itreetools.org/>

Trees provide more than just beauty and shade.

They remove hazardous pollutants from the air you breathe, absorb carbon dioxide from the air to store as wood, and control storm water by intercepting and absorbing rainfall.

Tools for Assessing Individual Trees

easy

MyTree

Are you new to i-Tree? Start with our EASIEST tool! MyTree helps you quickly assess **individual trees** with a minimum of fuss.

Education Value Model

- [ESML-875](https://doi.org/10.1016/j.ecoser.2018.03.005) Hutcheson et al. 2018
[doi:10.1016/j.ecoser.2018.03.005](https://doi.org/10.1016/j.ecoser.2018.03.005)
- Calculates the benefit (\$ value) of ecosystem services
- The educational value to Gary Indiana of one visit for all high school seniors (public and private) to learn about the ecosystem services incorporated into the LSJ project is approximately \$54,236

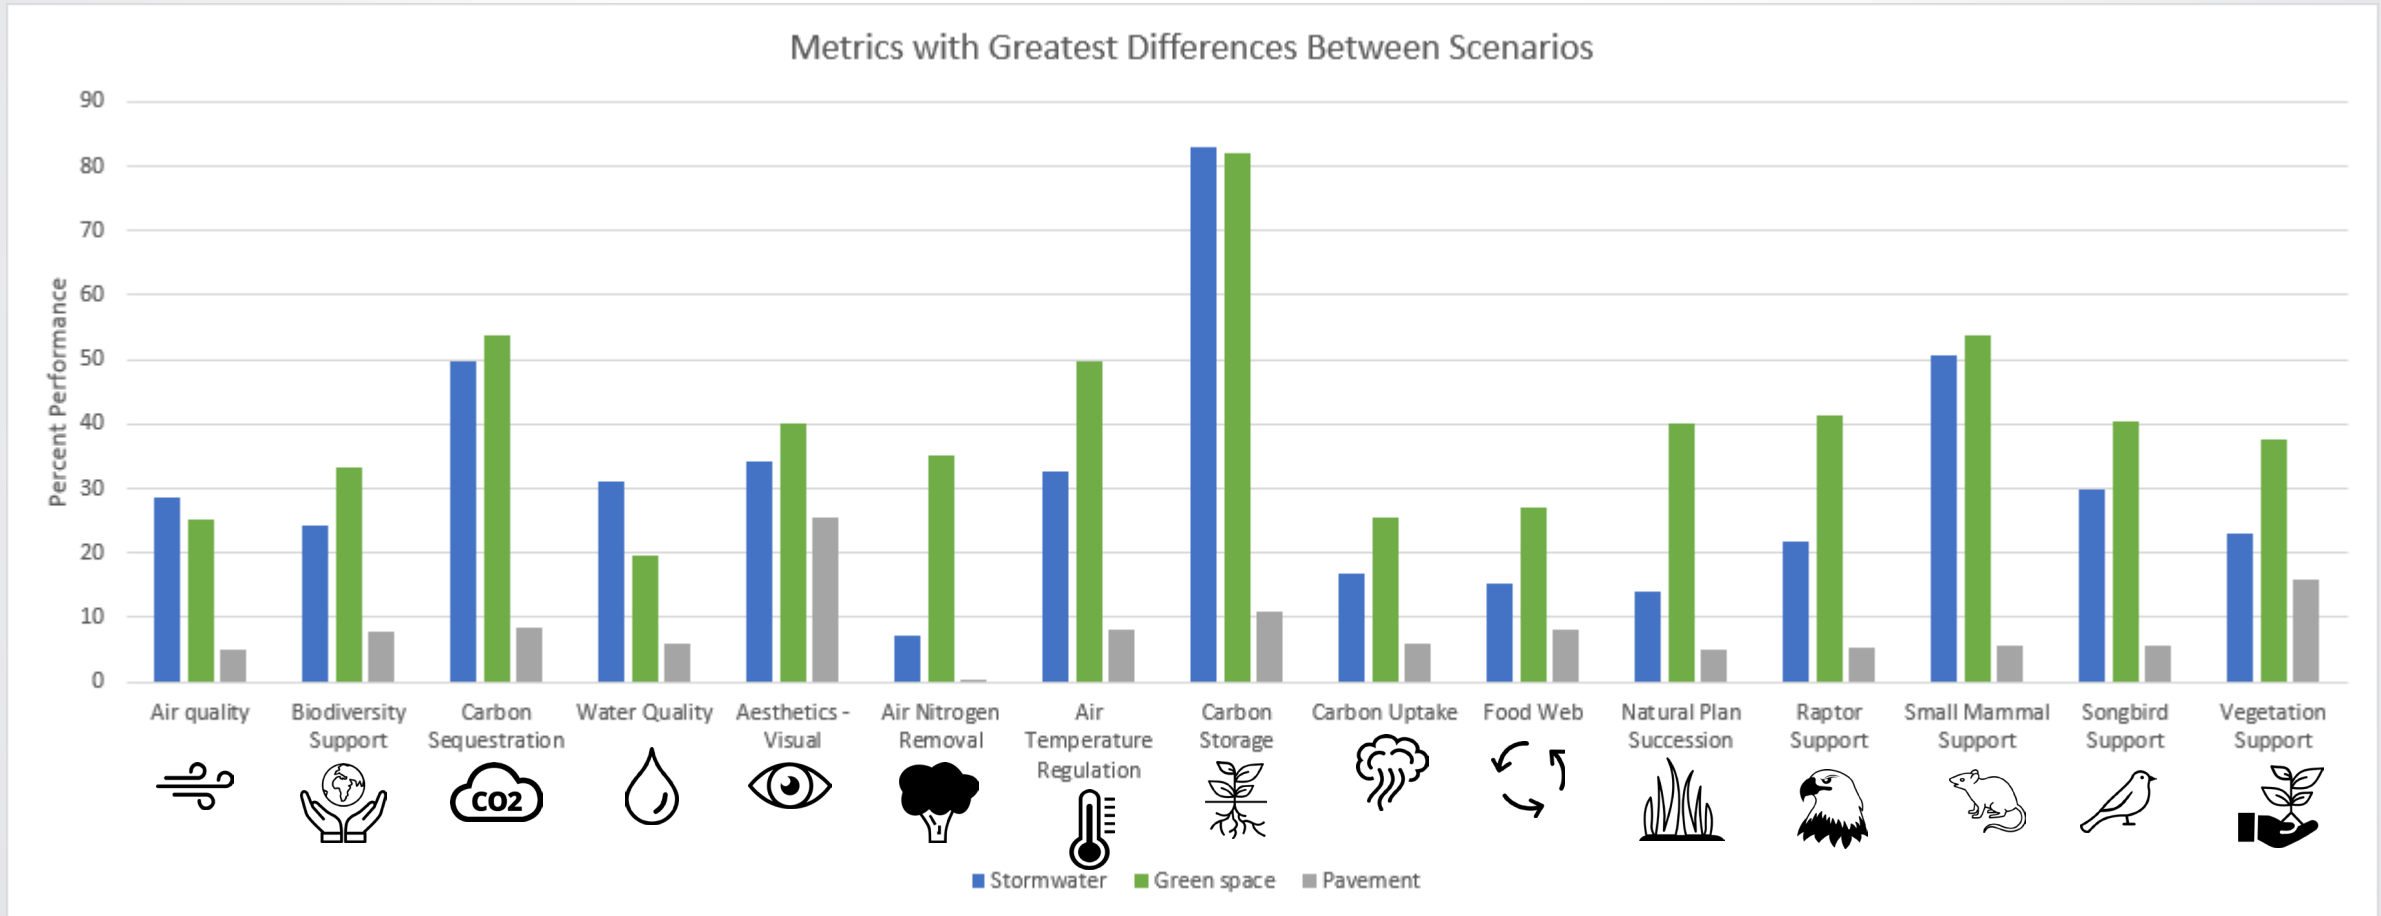

**ecosystem
intelligence™**

DRIVING PERVASIVE POSITIVE IMPACT

High-level planning tool provides initial rough estimates

<https://www.ecosystemintelligence.com/>

Beyond Lake Sandy Jo

“The commercial reuse of a site like [Lake Sandy Jo] can bolster local economies by supporting jobs and generating revenue. Moreover, what we see at this site is the importance of bringing the local community in on redevelopment plans so they can share their goals and vision for revitalization” EPA Region 5 administrator Debra Shore

- The intent is that this approach would be useful for sites other than Lake Sandy Jo
 - That the city is empowered to take this approach for other sites/projects

Lake Sandy Jo Ecosystem Service Modeling

Wildflower Planting Mix

- Shows the impacts of increasing pollinator habitat
- Planting a targeted wildflower mix enhances pollinator diversity and presence over time

EPA Stormwater Management Model (SWMM)

- Used for planning, analysis, and design related to stormwater runoff
- Using Low Impact Controls, like rain gardens and street planters, reduce flooding and runoff

Information for Planning and Consulting (IPAC)

- Tool to identify the critical and endangered species in an area as well as migratory birds that pass through
- Setting up natural green spaces could provide habitat for 10 locally endangered species in northern Indiana as well as for 15 species of migratory birds

Education Valuation Model

- Calculates the benefit (\$ value) of ecosystem services
- The educational value to Gary Indiana of one visit for all high school seniors (public and private) to learn about the ecosystem services incorporated into the LSJ project is approximately \$54,236

Estimated ecosystem services from models

25 Species Protected

Developing green spaces will create habitat for **10** critical / endangered species as well as **15** species of migratory birds

33% Decrease in Stormwater Runoff

Building low impact controls will result in a **33%** decrease in surface runoff and exfiltration loss, along with a **66%** decrease in external outflow

Education Value of \$54,236

Investing in educational green spaces could result in **\$54,236** of educational value for an all high school seniors class student trip

4X More Pollinators

Planting a mix of local wildflower species in the ecosystem services area will support an increase in bee pollinator abundance
