

Background and Objectives

- * The sustainable management of agricultural systems and the ability to provision a growing demand for food and renewable energy, will require a balanced consideration of different ecosystem services. Therefore, it is crucial to identify optimal management practices with a balanced consideration of different ecosystem services to maintain sustainable agricultural systems. It is also vital to determine optimal allocation of provisioning services to achieve the most efficient utilization of natural resources.
- This study shows a case study on optimization of ecosystem services for land management, and resource distribution in corn production systems in Larimer County, CO by:
 - Combining DAYCENT (a biogeochemical model) with GREET (a life cycle assessment model), and GMOS/NetSim (a network
 - optimization tool) for measuring, valuing, and optimizing ecosystem services.
 - Developing of a multi-level optimization framework.
 - Applying the framework to corn production for a landscape in Larimer County, CO.

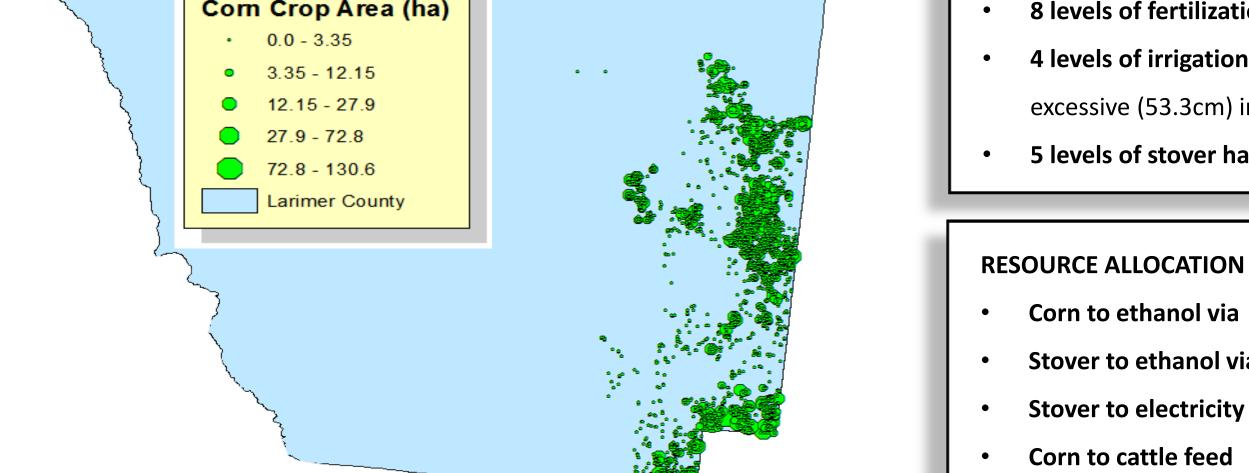

Fig 2: Corn Area in Larimer County, CO

DAYCENT Model:

- Soil data from SSURGO2
- Weather data from NARR
- Land use history baselines from CSU's EPA simulation (2011)
- Land management is assumed to remain unchanged during the simulation (30 years or 50 years)

OPTIMIZATION OF ECOSYSTEM SERVICES FOR LAND MANAGEMENT AND RESOURCE ALLOCATION IN AGROECOSYSTEMS. Trung Nguyen^a, Julien Granger^b, Christian Davies^b, Jay Wise^b, Keith Paustian^a ^a Department of Soil and Crop Sciences, Colorado State University

^b Shell Technology Center Houston

- **4 levels of irrigation:** no irrigation (0 cm), limited (21cm), full (42cm), and
- excessive (53.3cm) irrigation
- **5 levels of stover harvest:** 0%, 22%, 35%, 52%, 83%

RESOURCE ALLOCATION OPTIONS:

- **Corn to ethanol via** dry or wet milling
- Stover to ethanol via gasification or fermentation
- Stover to cattle feed

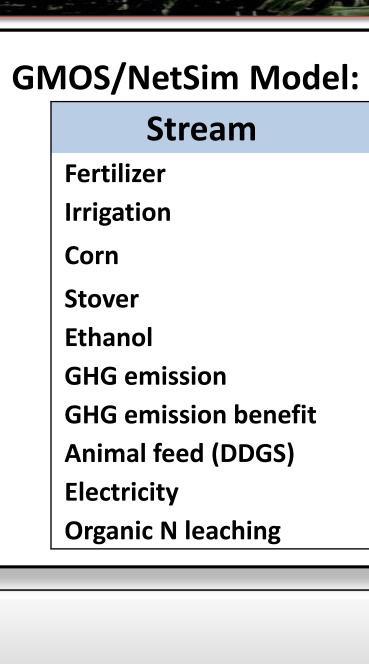

GREET Model:

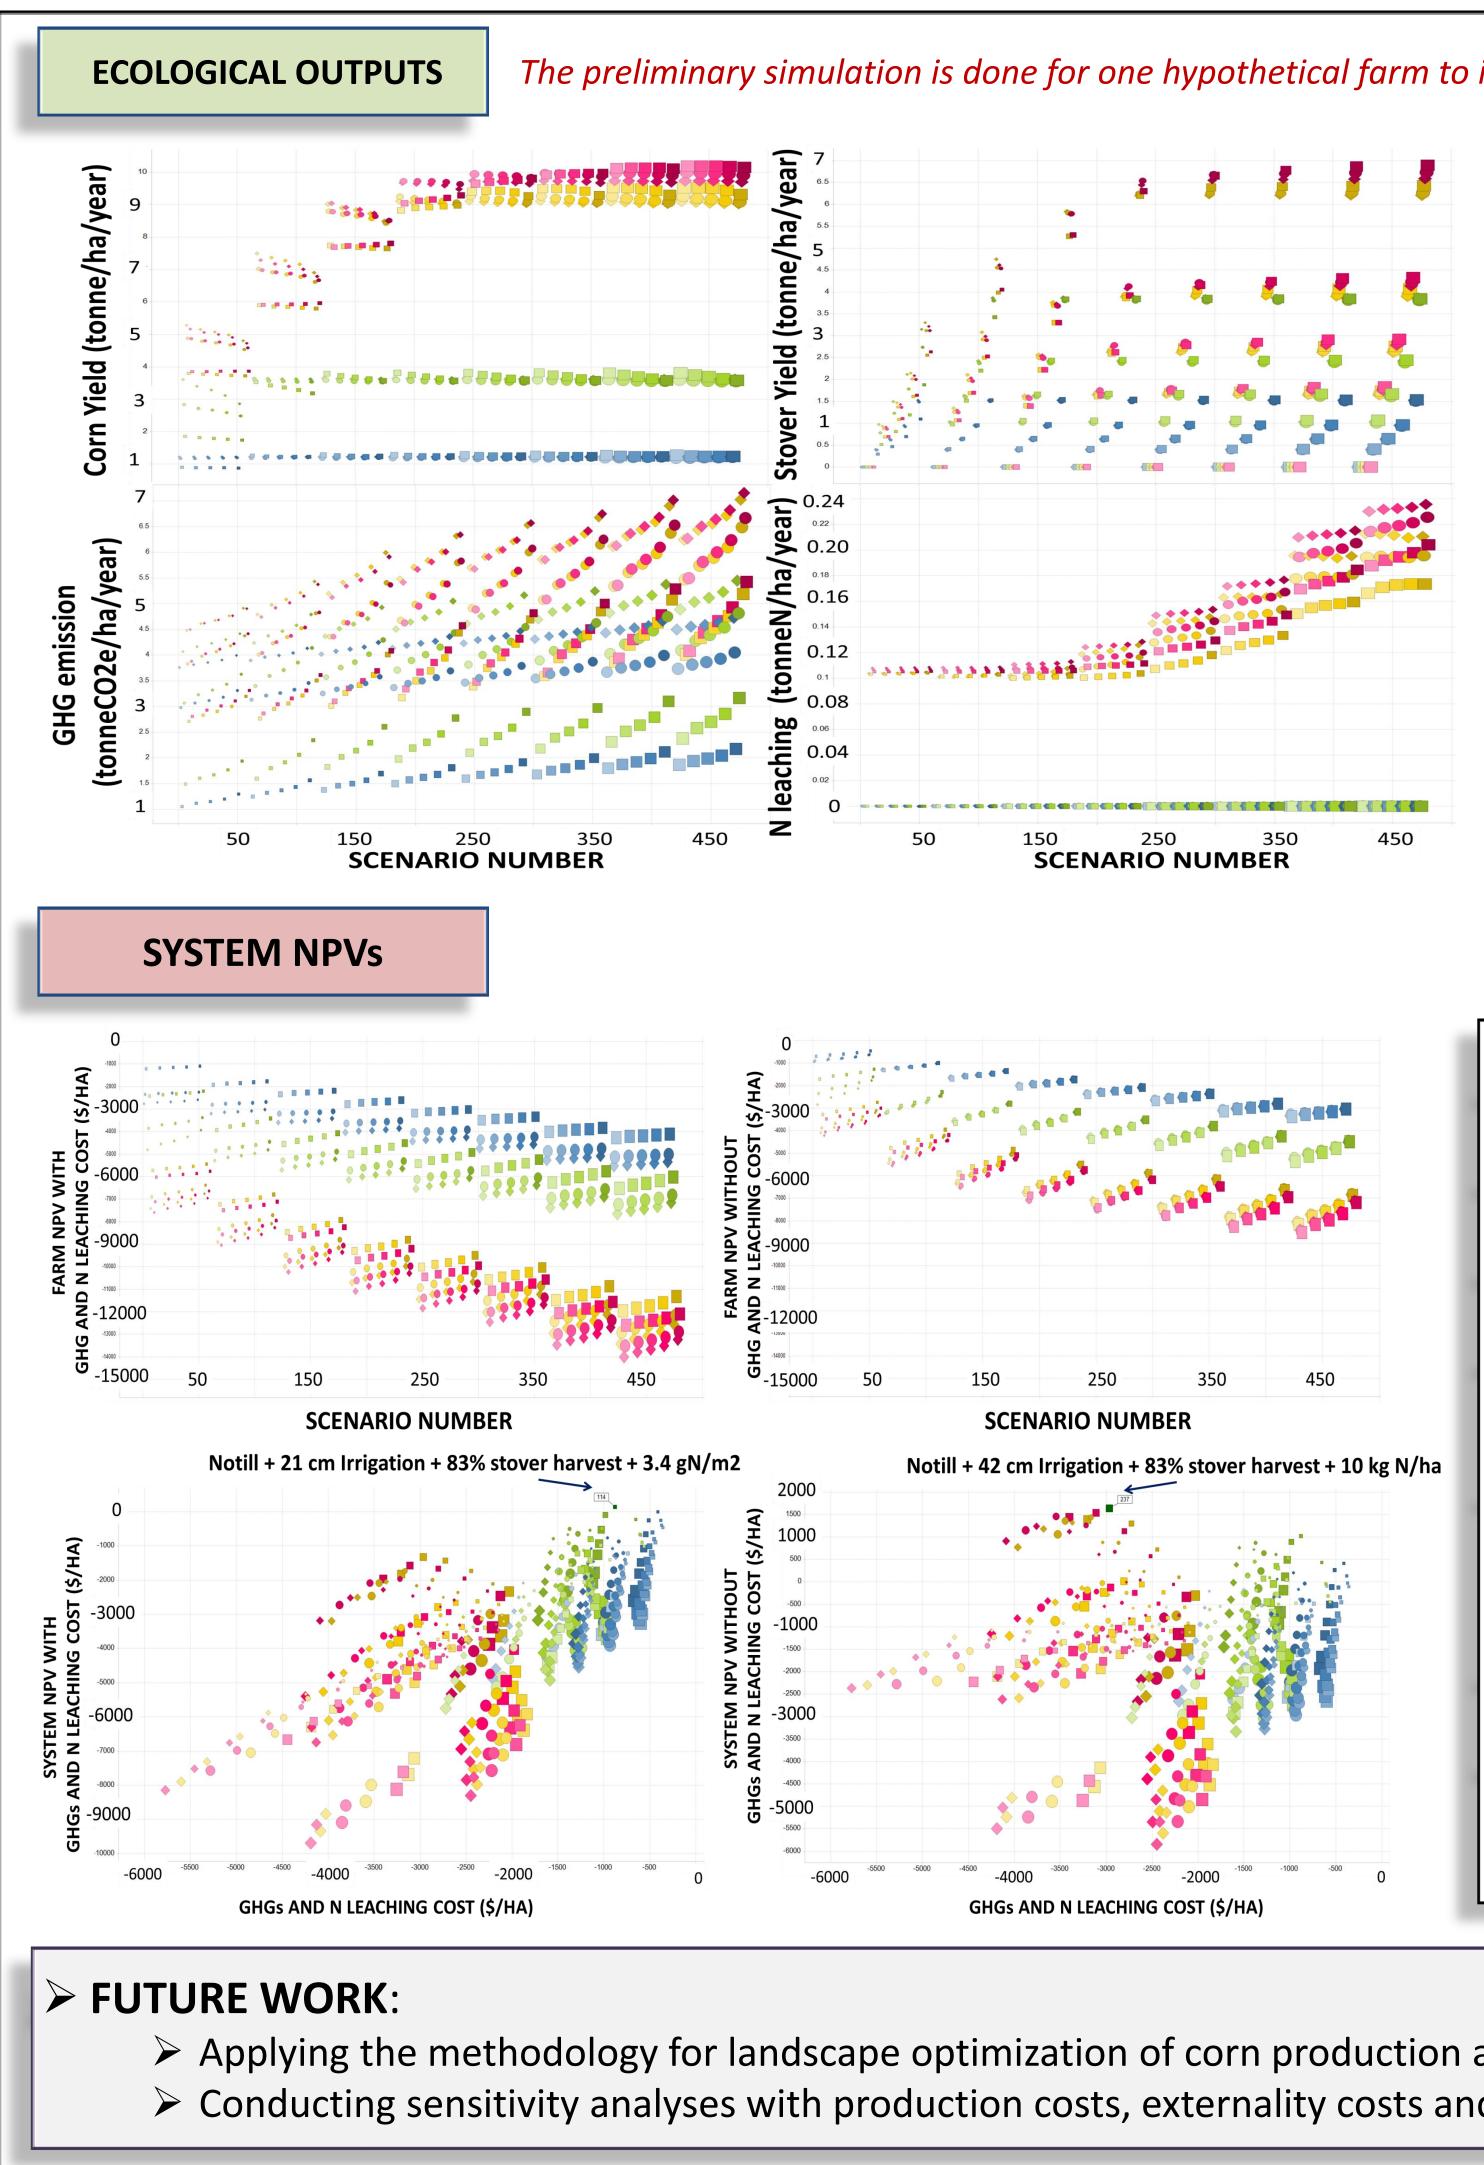

Corn farming operation (mt CO ₂ e/mt)
Corn harvest and handling (mt CO ₂ e/mt)
WTP stover ethanol via fermentation (mt CO ₂ e/gallon)
WTP stover ethanol via gasification (mt CO ₂ e/gallon)
WTP corn Ethanol via dry milling (mt CO ₂ e/gallon)
WTP corn Ethanol via wet milling (mt CO ₂ e/gallon)
WTP electricity from corn stover (mt CO ₂ e/MWh)
