Oregon State University & Portland State University

Bobby Cochran

Willamette Partnership

Fraser Shilling

Road Ecology Center, U.C. Davis

# Integrated Ecological Framework (IEF)

STEP 1: Build and strengthen collaborative partnerships and shared vision/values

STEP 2: Build the foundation for a regional ecosystem framework: Integrate conservation, natural resources, watershed, and wildlife management plans.

STEP 3: Populate the regional ecosystem framework: Integrate conservation and restoration priorities and plans for the target region into transportation plans.

STEP 4: Assess transportation effects on resource conservation objectives stated in the REF.

STEP 5: Establish and prioritize opportunities for conservation.

STEP 6: Develop an up-front crediting strategy to accompany the Regional Mitigation Strategy.

STEP 7: Develop programmatic permits/consultations or other programmatic document agreements.

STEP 8: Assure implementation on the transportation side. Design projects and integrate programmatic agreement measures to minimize impacts to resources.

STEP 9: Update REF annually/as important new information becomes available and balance predictability and adaptive management so funding and staff time can be allotted appropriately and schedules can be met.

# Transportation Crediting

- FHWA funded a team effort with OSU, Willamette Partnership, U.C. Davis, NatureServe, ICF & Venner Consulting to promote crediting strategies.
- The team did a literature search, a state-of-the-practices, and two crediting frameworks.
- Framework 1 is a transportation crediting strategy guide for agencies with limited crediting experience.
- Framework 2 is a valuation and crediting for agencies with complex conditions.

# Crediting at DOTs and MPOs

CALTRANS

Colorado DOT

Florida DOT

**Maryland DOT**

Minnesota DOT

**North Carolina DOT**

Ohio DOT

**Oregon DOT**

Texas DOT

Virginia DOT

Washington DOT

Atlanta Regional Commission

Charlottesville – Albemarle MPO

East – West Gateway COG

Houston-Galveston Area Council

Lane COG

Ohio-Kentucky-Indiana Regional COG

Pikes Peak Area COG

Rogue Valley COG

San Diego Association of Governments

Thurston Regional Planning Council

# Existing State Crediting & Trading Programs

- North Carolina Ecosystem Enhancement Program
  - Wetlands and Stream Mitigation & Crediting Program involving NC DENR and DOT
- Maryland Watershed Resources Registry
  - Interagency mapping approach to characterize and prioritize mitigation, restoration and conservation
- Willamette Partnership and Clean Water Services
  - Multiple trading, focused on ESA and CWA regulatory drivers
- California – CEQA, RAMP and SAMI
  - Existing ESA and Wetland Banks potentially linked through newly developing initiatives.

# Critical Factors for Success in Crediting

- The Desire or Perceived Need for Crediting.
- State Agency Organization and Structure.
- State, Federal and MPO Agency Relationships.
- History of Partnerships between regulatory agencies and others, particularly with DOTs.
- The availability of NGO partners with crediting experience.

# Framework 1

## Ecosystem Crediting Strategy for Transportation

**WILLAMETTE PARTNERSHIP**

4640 SW Macadam Ave., Suite 50, Portland, OR 97239 | T: 503.946.8350 | F: 971.229.1968 | W: [www.willamettepartnership.org](http://www.willamettepartnership.org)

# Why build and ecosystem crediting strategy?

- Predictability for implementing projects
- Certainty that conservation goals are met
- Consistent way to track and account for conservation and development activities

# Components of an Ecosystem Crediting Strategy

- Credit quantification tools
- Protocol for creating & tracking credits
- Regulatory approval process
- Credit procurement process

# Feasibility: Do we need a strategy?

- Demand: Potential vs. Real; Type; Volume; Timing; Locale
- Supply: Usually a short-term barrier in first 1-2 years
- Science: It exists at the right scale, and people like it
- Policy: Authorities exist to make room for crediting
- People: Partners in place ready to implement

# Design: Build a strategy

- Be clear on what counts as a credit
- Have a standard process for confirming credit projects are performing over time
- Ensure there is an account ledger of credits that's available for the agencies and the public to see what's going on
- Risk and uncertainty is inherent: Be upfront about it, and clear how you manage it
- Make sure there's a plan for when something goes wrong

# Operations: Maintaining a strategy

- Identify who will do what
  - Buyers & Sellers
  - Strategy Administrators & Verifiers
- Choose a procurement strategy
  - Banks, permittee-sponsored, and In-lieu mitigation can all work
  - Depends on capacities and goals
- Plan and budget for adaptive management
  - Monitoring & reporting
  - Ongoing improvement

A background image of the Golden Gate Bridge in San Francisco, showing the red suspension bridge structure against a hazy sky and water.

# Framework<sup>2</sup>

addresses states with exceptionally complex issues and a large number of ongoing programs, especially those with local, regional or statewide statutes that include crediting programs.

# Approach

5-step valuation process

Two geographic/planning scales – region and corridor

Incorporate findings into regional system planning, regional project prioritization, and project alternative analysis

Develop capacity within DOTs and clear decision-points to use valuation findings

Implement model valuation project with planners in select districts/regions

# Proposed valuation and crediting framework

## Assessing environmental impacts

Proposed changes in  
Regional Transportation  
Plans or Corridor Plans

Impacts:  
e.g. air/water pollutants,  
wetland alteration/loss,  
collisions with wildlife

Impacted systems:  
e.g. people, wildlife, plants

Impacts on human health,  
human welfare,  
environmental conditions

## Steps in valuation of environmental impacts

1. Identify potential impacts

2. Screen and categorize the  
impacts

3. Quantify the impacts

4. Value the impacts

5. Calculate credits based on  
valuation-threshold  
relationships

Account for uncertainty

Use credits system to  
compare project/  
decision alternatives

Use credits system to  
calculate total impact,  
avoidance/minimization  
strategy, compensatory  
actions

## Step 1: Identify the potential impacts

DOT guidance  
handbooks and manuals

State Environmental  
Requirements categories

NEPA

Other resources (e.g.,  
Victoria Transport Policy  
Institute; Asian  
Development Bank)

# Step 2: Screen and Categorize the Impacts

## Step 3: Quantify the Conditions & Impacts

- Requires data on potential risks, geographical and temporal extents of the impacts, and severity
- Express the impacts in the physical units to quantify the magnitude of each impact
- Also involve assessing the magnitude of the impacts and impacted elements
- Scientists would need to use models to quantify the impacts

### Examples:

- Dose-response functions – link expected exposure to stressors and impacts on receptors
  - Human health risk assessment models
  - Ecological risk assessment models
  - Ecological models
- Physical data would also need to be in a form that is suitable for monetization when analysts carry out an economic valuation study.

# Step 4: Calculate Values & Credits for Impacts on Environmental Conditions

**Determine desired and undesired reference conditions/targets**

**Policy guidance** (e.g., no wetland loss, air quality standards)

**Scientific literature** (e.g., habitat fragmentation effects on wildlife)

**Output** is a pair of targets – desired and undesired

**Describe relationship between credits and change in condition**

**Scientific literature** (e.g., linear increase in risk to health from changes in air quality parameters)

Differentiate between **relative impact** within a study area and total impact

**Output** is a mathematical relationship defining incremental credits and description of possible uses (e.g., comparison of alternatives, calculating equivalent fiscal cost).

# Step 5: Develop and use credits to:

- address relative impacts,
- inform project comparison, and
- develop fiscal equivalents

Example of using credits to compare among alternatives including structural and modal changes.

Credits are calculated based on comparison to desired and undesired conditions.

| Alternative                                                                                                                                                                                                         | Domain      | Desired Target            | Undesired Target         | Credits | Total |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|---------------------------|--------------------------|---------|-------|
| A. Lane addition; 20,000 AADT increase; short term 5% reduction in travel time, then 5% increase; 10% increase in air pollutants; 40 acres (2%) habitat consumption; 1,200 acres impacted area (60%, traffic noise) | AADT        | 20,000 reduction          | 40,000 increase          | -50     | -230  |
|                                                                                                                                                                                                                     | Congestion  | 20% reduction travel time | 20% increase travel time | 0       |       |
|                                                                                                                                                                                                                     | Air quality | 10% reduction             | 10% increase             | -100    |       |
|                                                                                                                                                                                                                     | Habitat     | 10% increase              | 10% decrease             | -20     |       |
|                                                                                                                                                                                                                     | Impact area | 0% increase               | 100% increase            | -60     |       |
| B. Light rail system augmentation; 10,000 AADT decrease; long-term 10% reduction in travel time; 5% reduction in air pollutants; 0 acres habitat consumption; 400 acres impacted area (20%, LRT noise)              | AADT        | 20,000 reduction          | 40,000 increase          | +50     | +130  |
|                                                                                                                                                                                                                     | Congestion  | 20% reduction travel time | 20% increase travel time | +50     |       |
|                                                                                                                                                                                                                     | Air quality | 10% reduction             | 10% increase             | +50     |       |
|                                                                                                                                                                                                                     | Habitat     | 10% increase              | 10% decrease             | 0       |       |
|                                                                                                                                                                                                                     | Impact area | 0% increase               | 100% increase            | -20     |       |
| C. No action; 15,000 AADT increase; 15% increase in travel time; 7.5% increase in air pollutants; 0 acres habitat consumption; 900 acres impacted area (45%, traffic noise)                                         | AADT        | 20,000 reduction          | 40,000 increase          | -38     | -233  |
|                                                                                                                                                                                                                     | Congestion  | 20% reduction travel time | 20% increase travel time | -75     |       |
|                                                                                                                                                                                                                     | Air quality | 10% reduction             | 10% increase             | -75     |       |
|                                                                                                                                                                                                                     | Habitat     | 10% increase              | 10% decrease             | 0       |       |
|                                                                                                                                                                                                                     | Impact area | 0% increase               | 100% increase            | -45     |       |

# Possible decision-points for the use of valuation/crediting in planning, programming, and project evaluation

**Simplified Statewide and Regional Planning and STIP Programming Cycle**  
**Figure 1 - Project Initiation Document Links Planning to Programming**

Complement benefit-cost analysis (e.g., Caltrans' Cal-B/C model) at the programming stage

# Summary

- Trading & Banking have long been known and used by DOTs and MPOs, but multi-crediting systems remain rare.
- The framework 1, developed by the Willamette Partnership, provides easy to use methods & tools for agencies wanting to get started.
- Framework 2 is a more complex methodology that includes valuation in mitigation crediting and all aspects of transportation decision making.
