Stewardship

| Protection status | Example |
|--|------------------------------------|
| Status 1 and 2 Lands managed to maintain biodiversity (i.e., protected areas network) | Yellowstone National Park, Wyoming |
| Status 2 | |
| Status 3 Lands managed for multiple-use, including conservation | Kaibab National Forest, Arizona |
| Status 4 Lands with no permanent protection from conversion, but may be managed for conservation | Fort Irwin, California |
| No Status | Private Land |

Reptile Richness per NLCD Category

■ All Reptiles Mean
 ■ Lizards Mean
 ■ Snake Mean
 ■ Turtles Mean
■ IUCN Mean
 ■ PARC Mean
 ■ G1G2G3 Mean
 ■ Rare Area Mean

Conclusions

- Metrics suggest current Protected Lands system are not sufficient;
 - For all metrics
- Metrics suggest current Status 1-3 Lands are sufficient
 - All Reptiles, Lizards, Snakes, G1G2G3 and PARC
 - Marginally Turtles and IUCN
- Other Lands (not Status 1,2, and 3) are sufficient

Conclusions

- Semi-Desert has the most richness
- Forest/Woodlands and Shrubs/Grasslands next
- Turtles are high in aquatics
- Relatively high richness is modified lands
 - Snakes
- Reptiles are an interesting ES model because:
 - Understudied
 - General fear and loathing
- Ecosystem Services can play an important part in Conservation

Reptile Ecosystem Services

| Benefit Category EnviroAtlas | Function, Service, Goods | Description |
|---------------------------------|-----------------------------|---|
| Food, fuel and materials | Food | Turtles and tortoises are eaten across the world. Alligators. Snakes and lizards in some degree |
| | Medicine | Anti-venom and blood thinning drugs. melanoma (Gila monster; Hailey et al. 2012), blood thinning (snakes), cardiovascular disease (snakes), pain (snakes), diabetes (Gila monster), and Alzheimer's disease (Gila monster (Lewis and Garcia 2003) |
| | Medicine | Traditional medicinal ingredients in Brazil from Alves et al 2009 |
| | Clothing | Boots, belts, hats |
| Recreation, culture, aesthetics | Pet Trade | Reptile collectors and breeders |
| Natural hazard mitigation | Disease transmission | Regulating disease carrying rodents. Ostfield and Holt (2004) suggest the complexities of this are "largely untested" |
| | Pest outbreaks | Regulating rodent populations |
| Recreation, culture, aesthetics | Awareness | Poison/venomous Snake hunting in OK |
| | Art | Art/books/mythology, music - |
| | Regulatory | Federally and state listed species are of concern to agencies and organizations. |
| | Religious | Used in various religious ceremonies |
| Biodiversity Conservation | Food web | Community structure and effect on trophic cascade |
| | Altering physical habitats | Ecosystem engineering such as tortoise burrows |
| | Cycling nutrients | Decomposition and primary production |

All Reptiles

Lizards

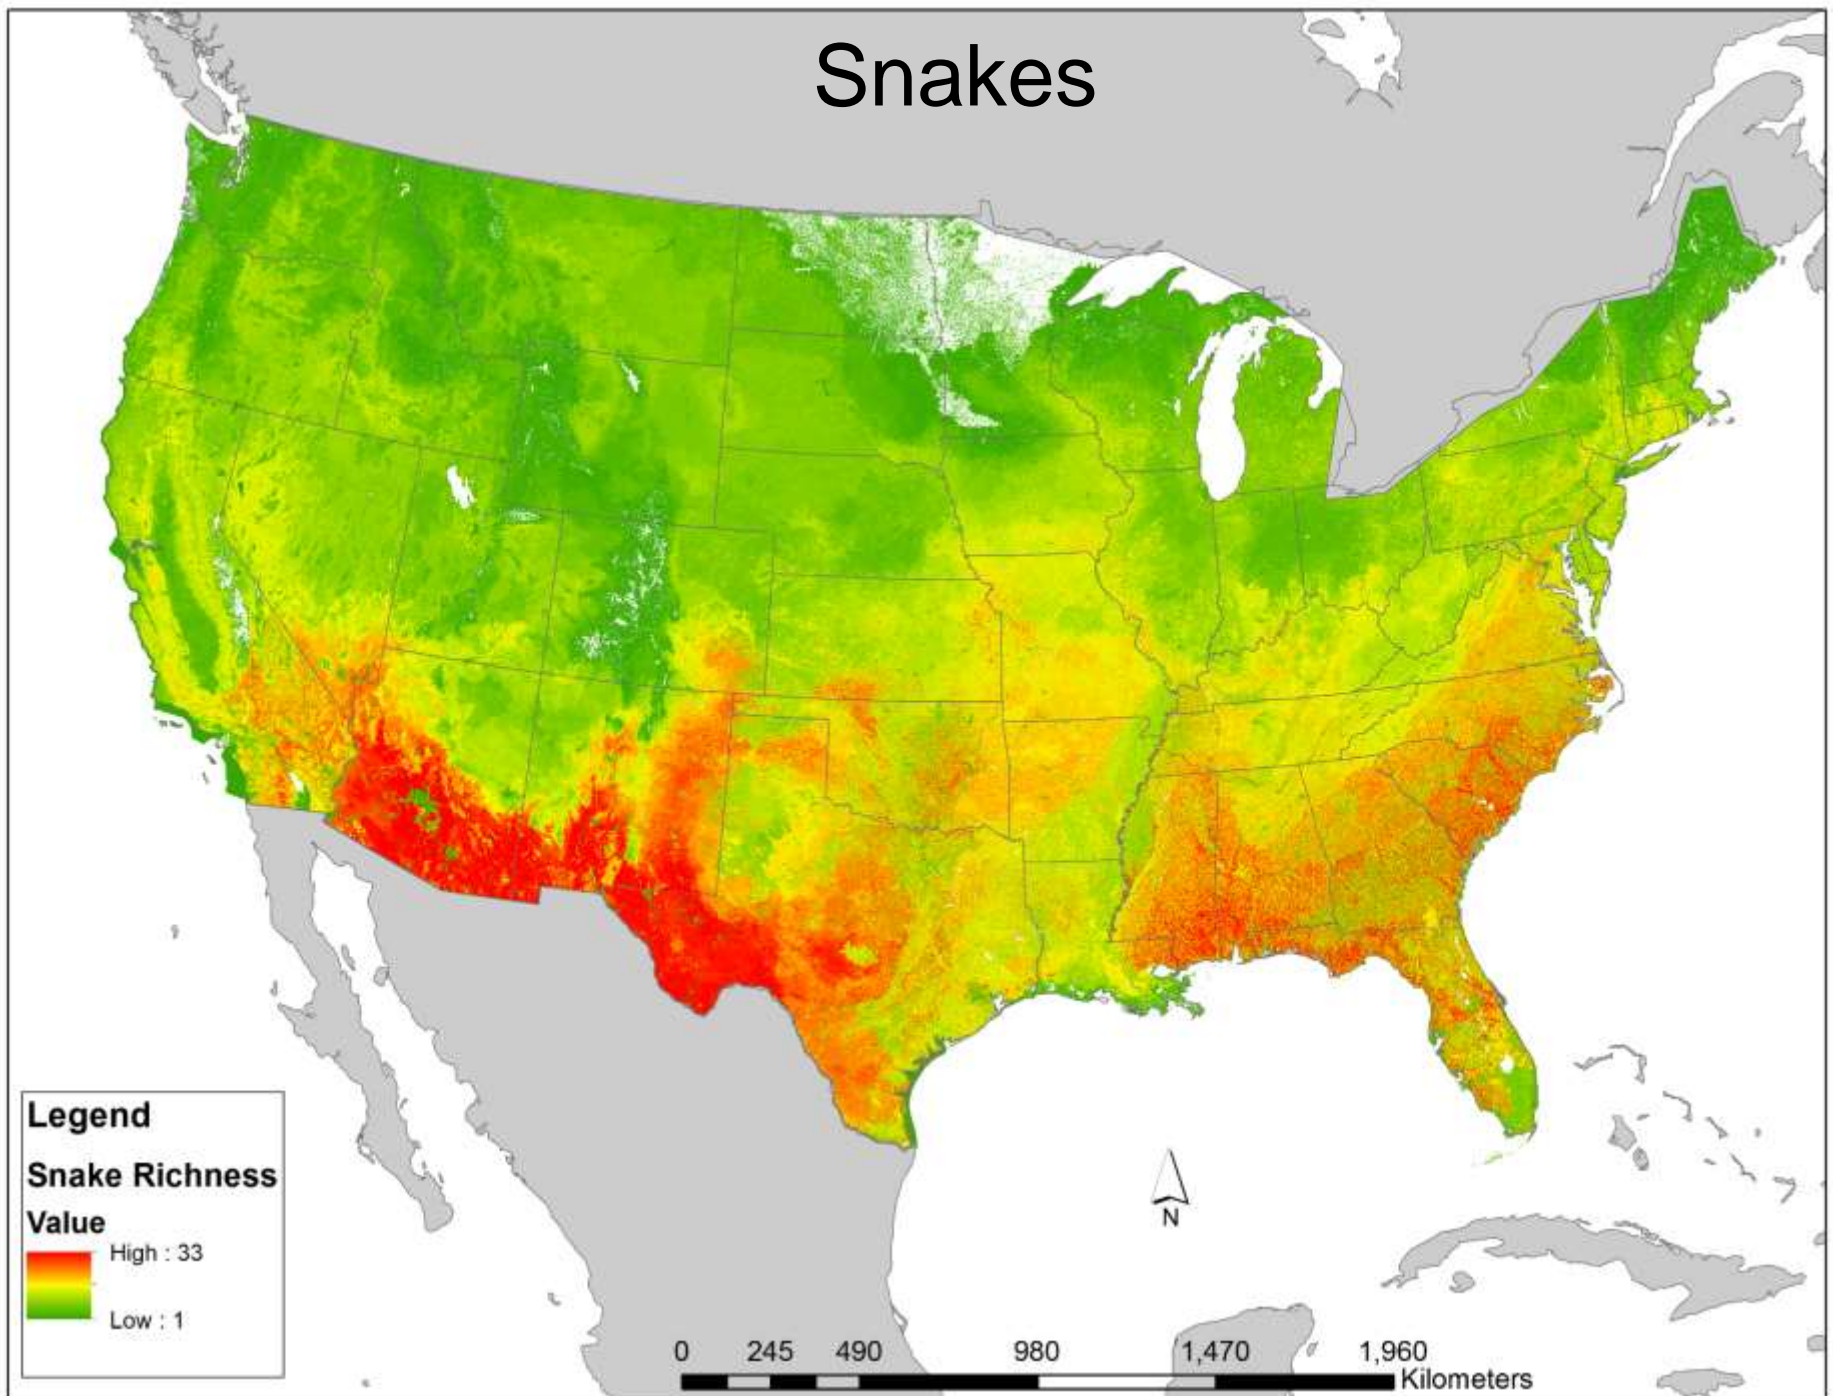

0 245 490 980 1,470 1,960 Kilometers

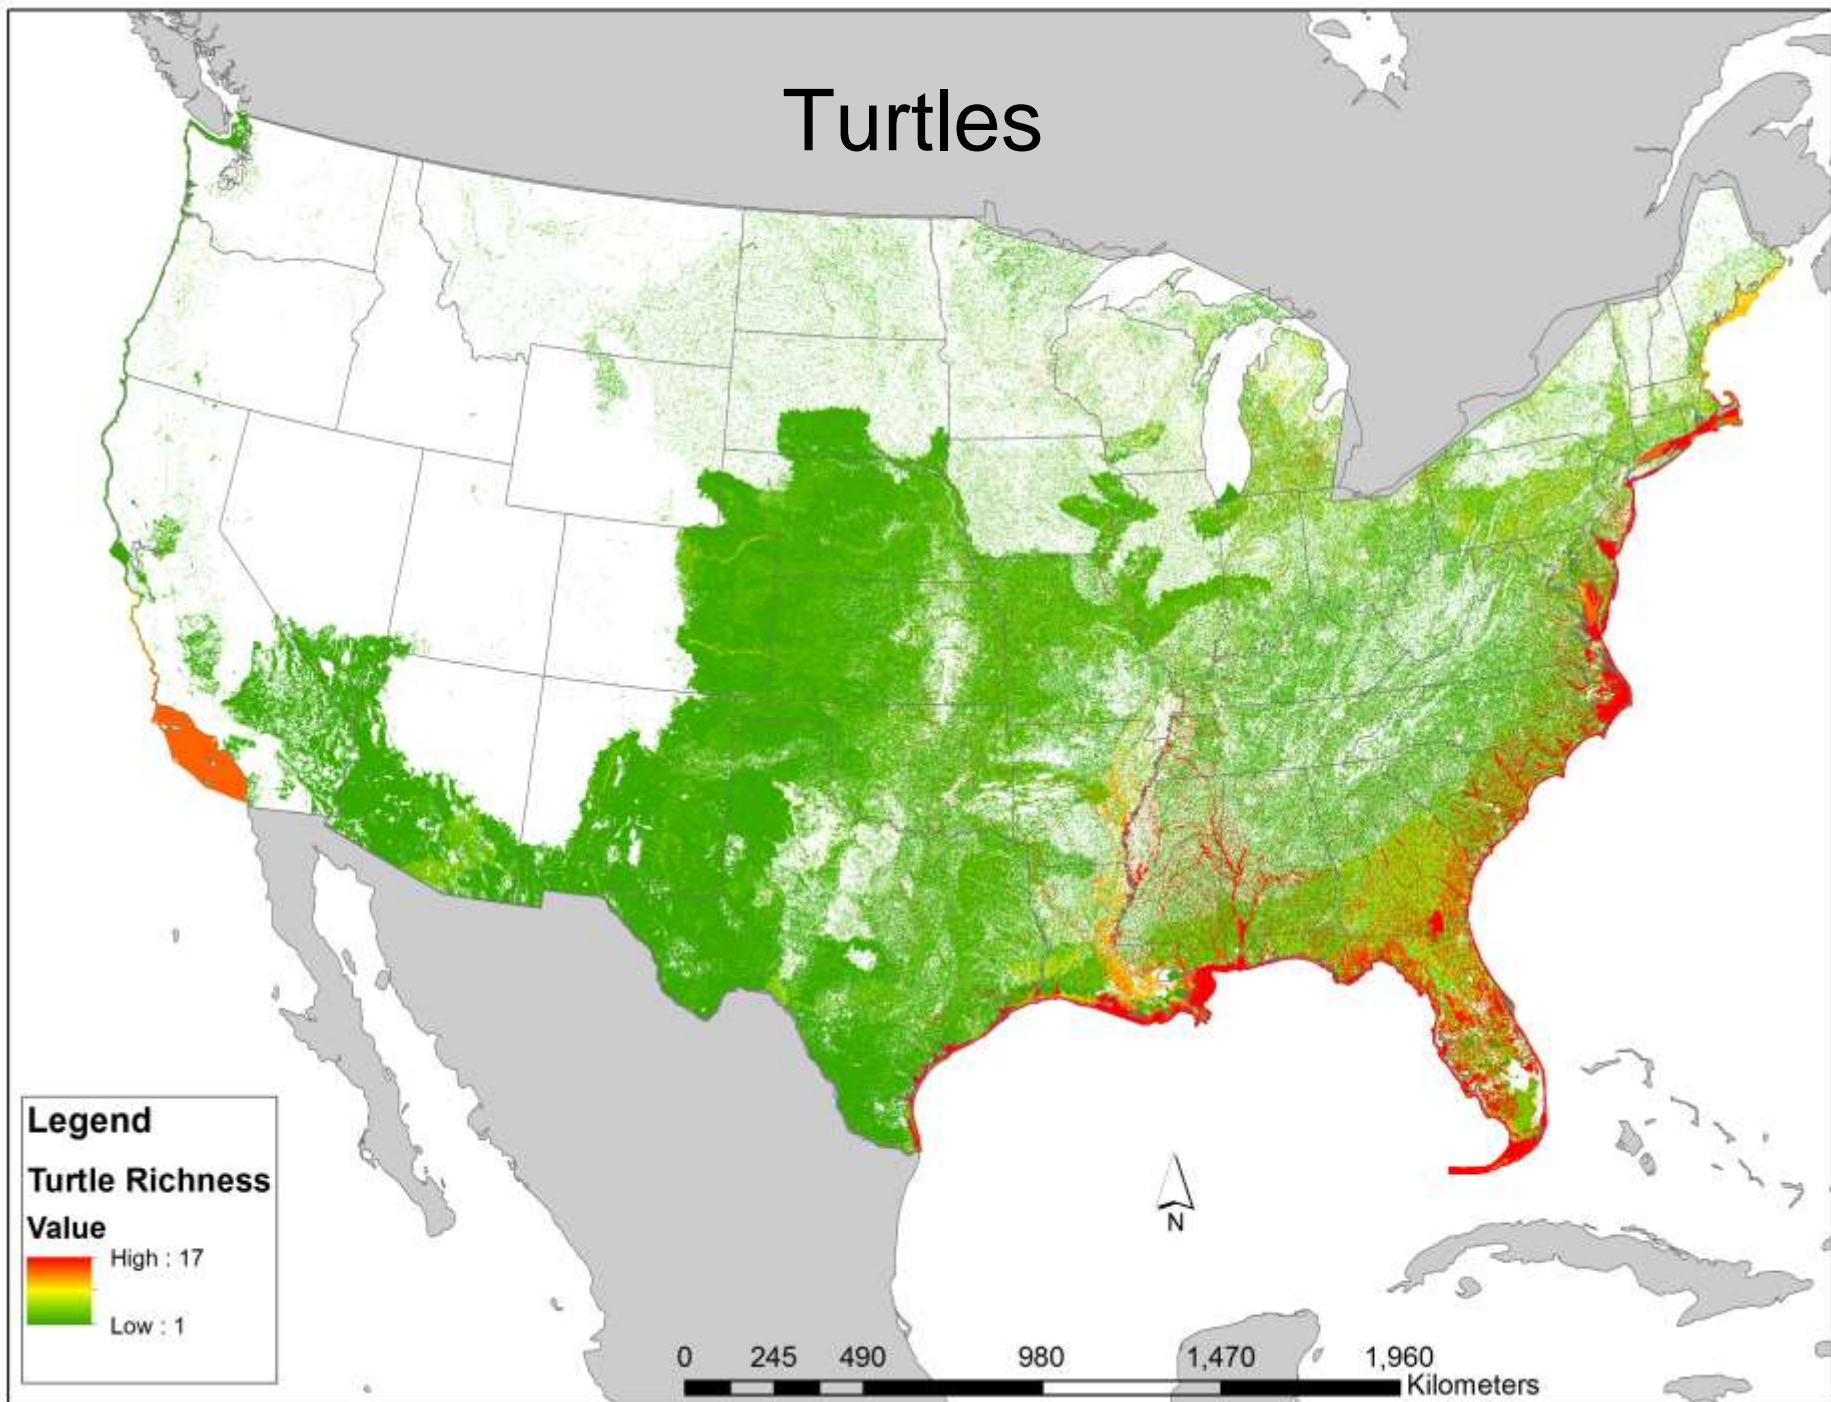

A scale bar at the bottom of the map indicates distances in kilometers, with markings at 0, 245, 490, 980, 1,470, and 1,960. A north arrow is located to the left of the scale bar, pointing towards the top of the map.

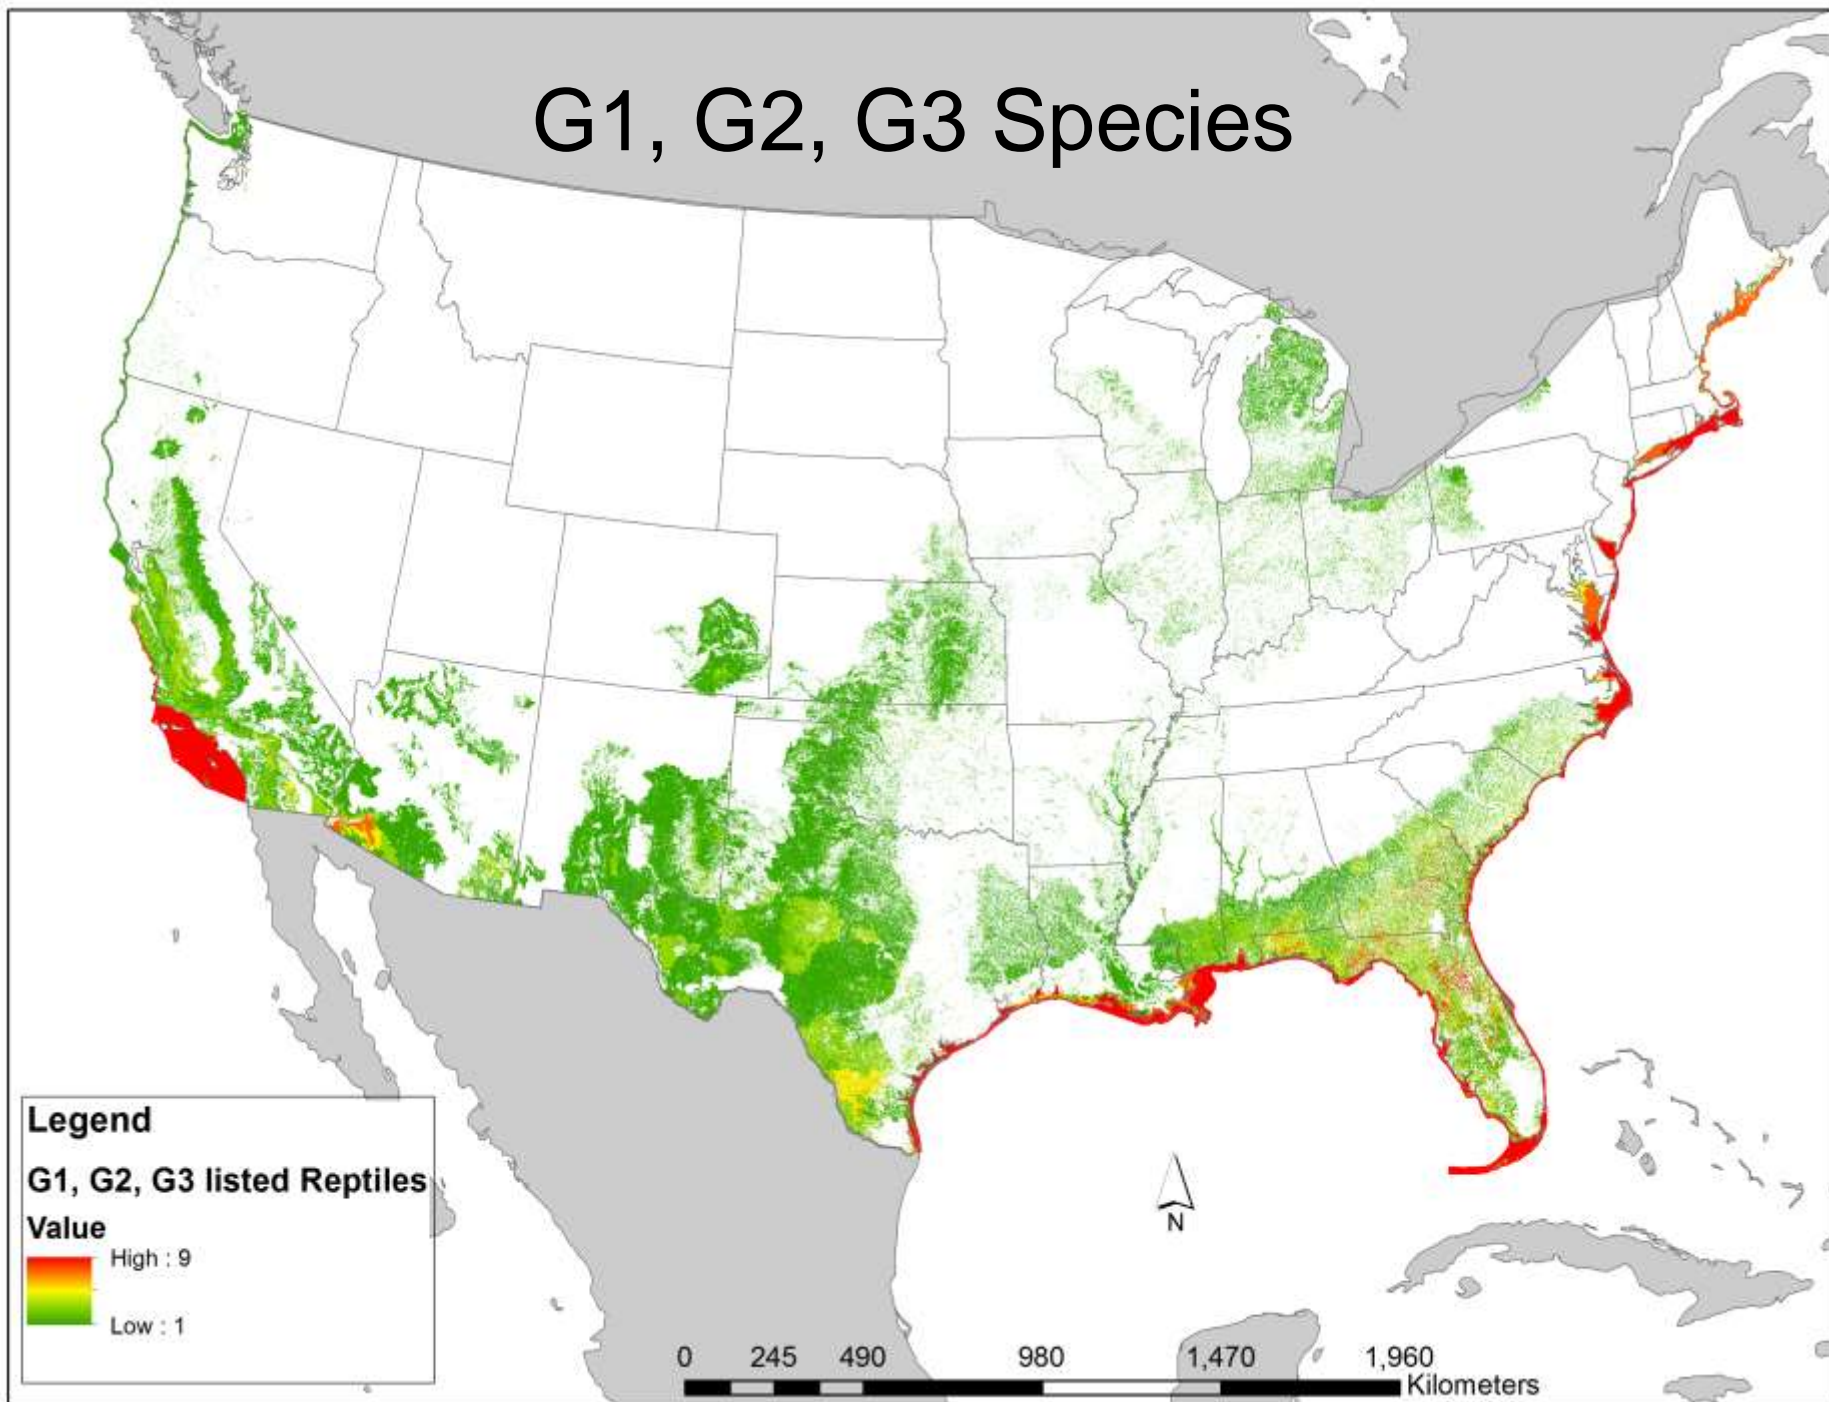

Snakes

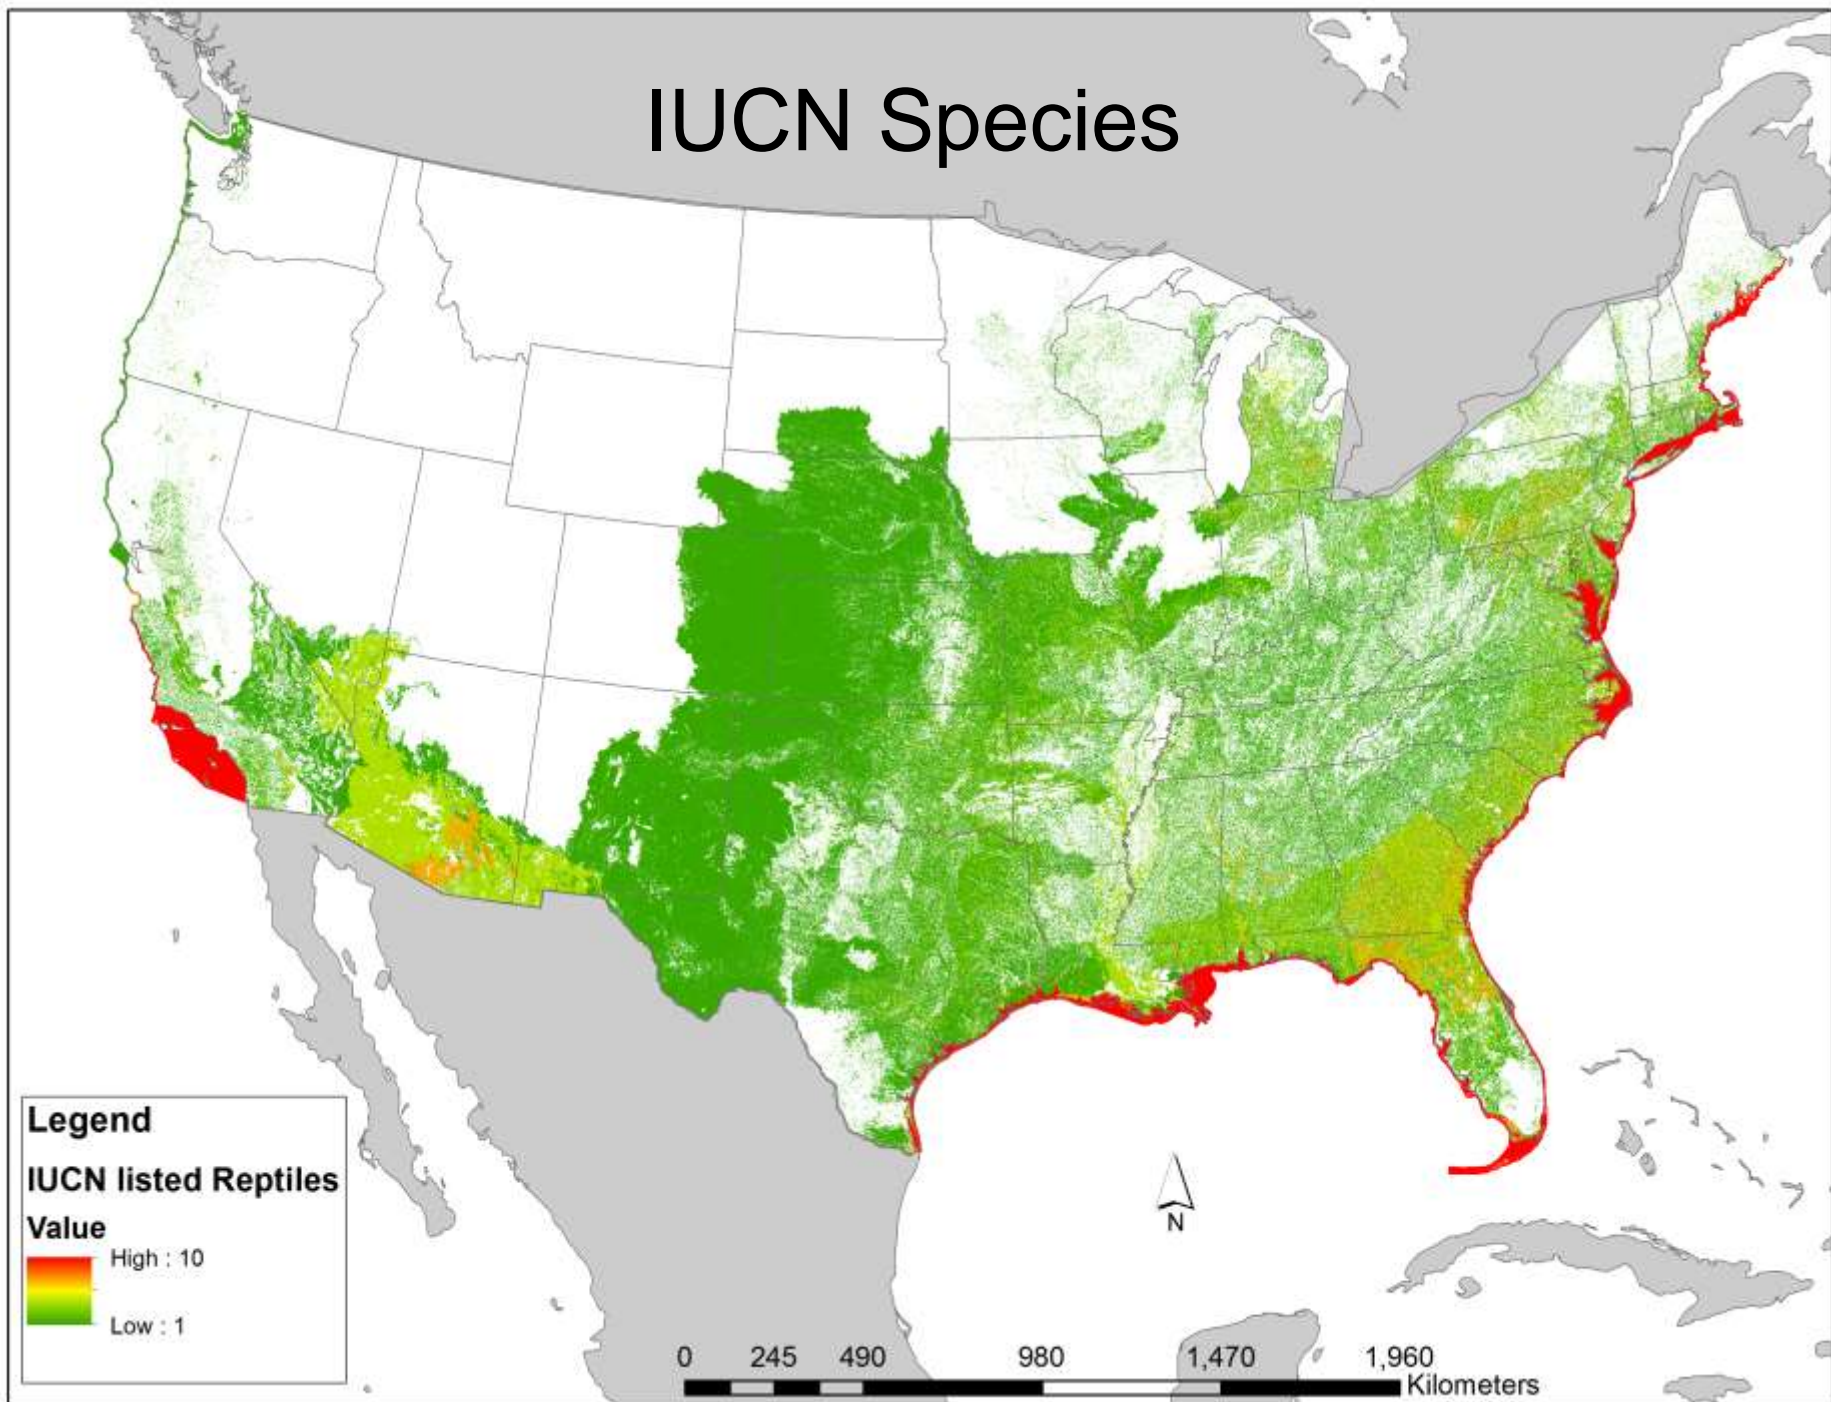

Turtles

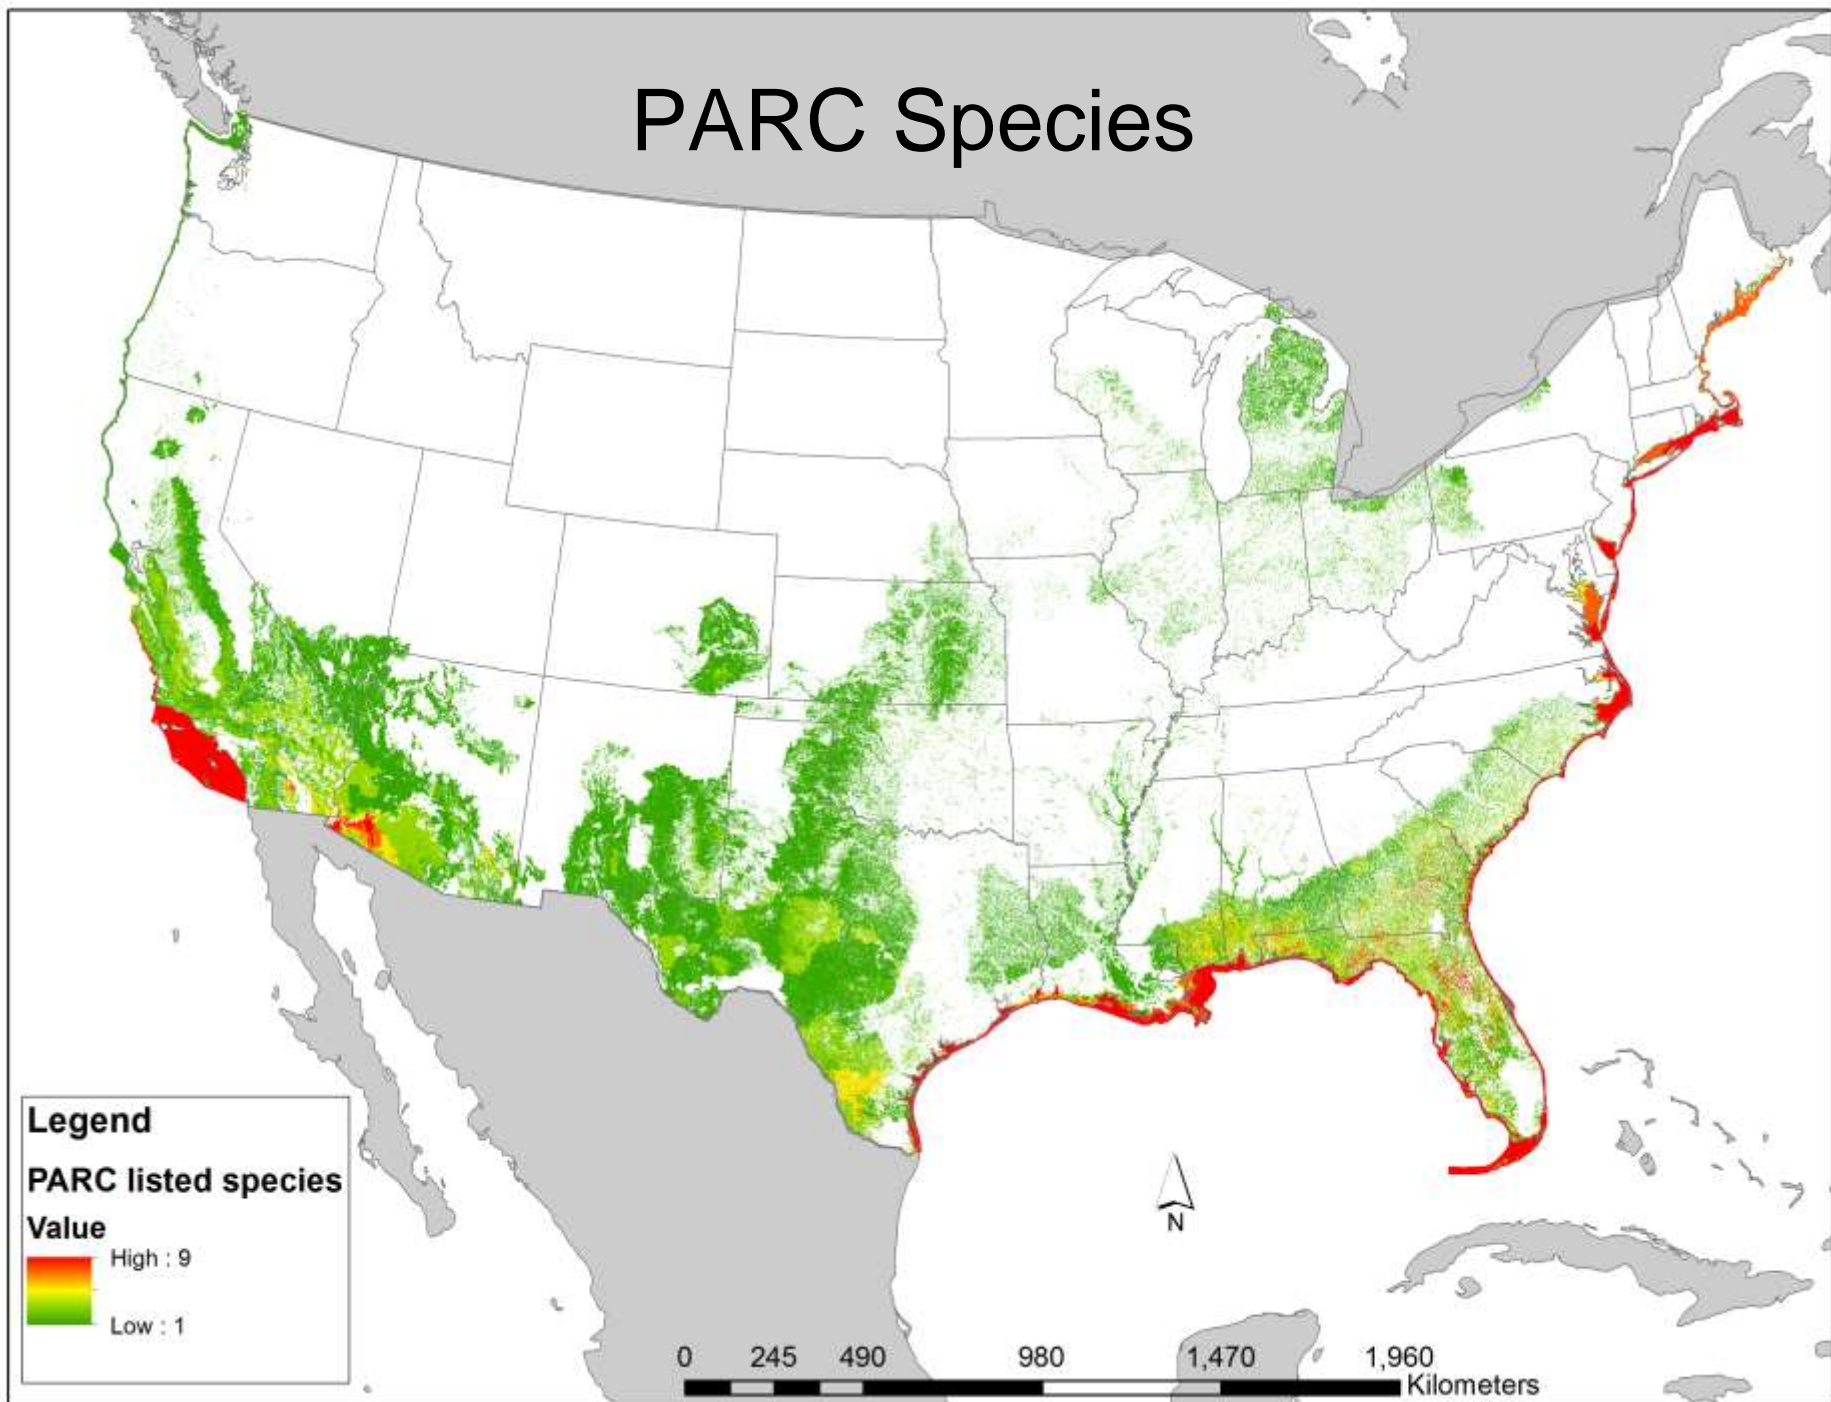

G1, G2, G3 Species

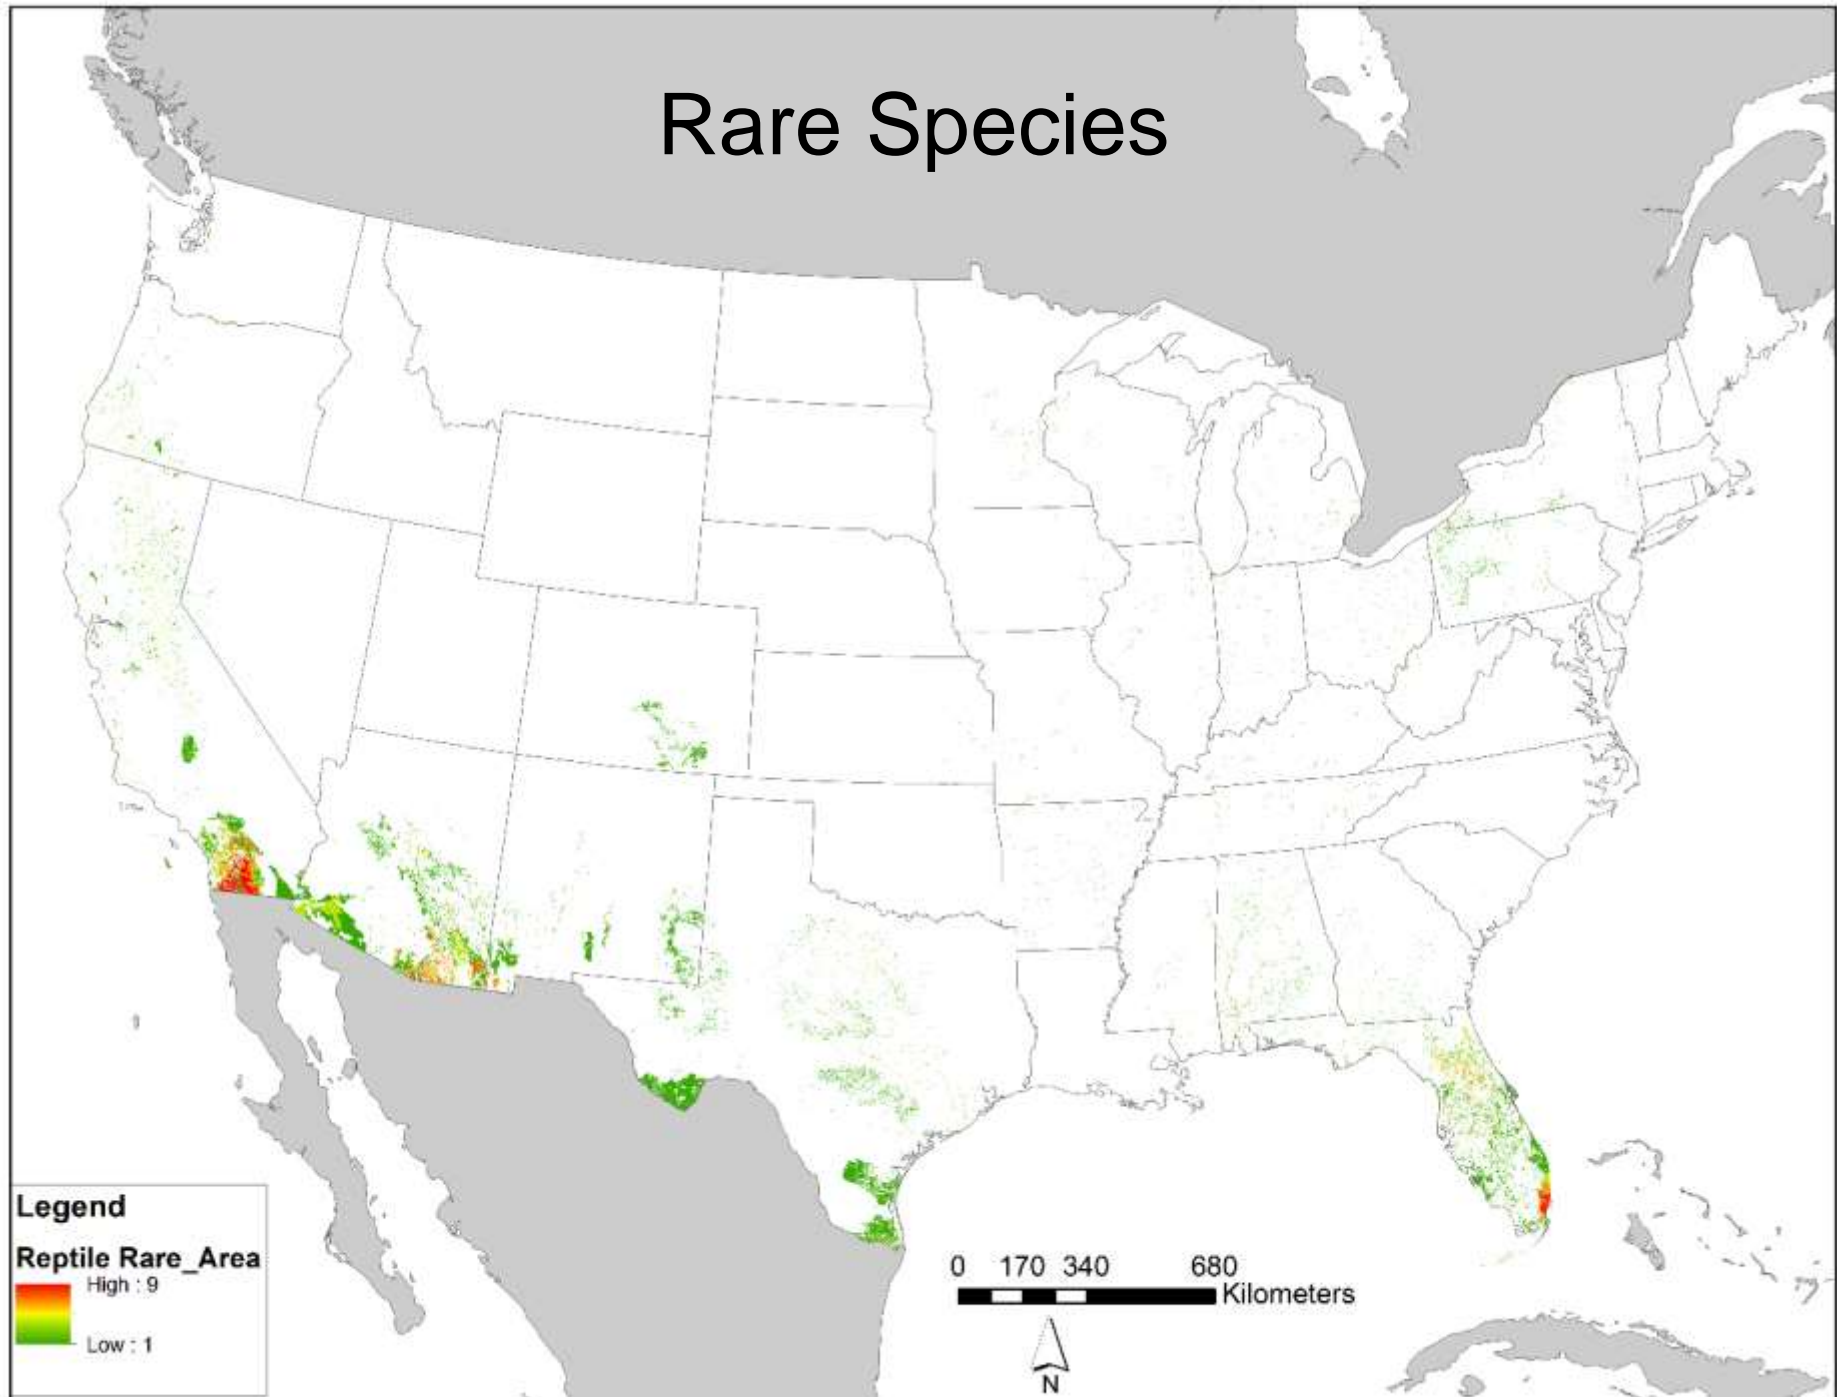

IUCN Species

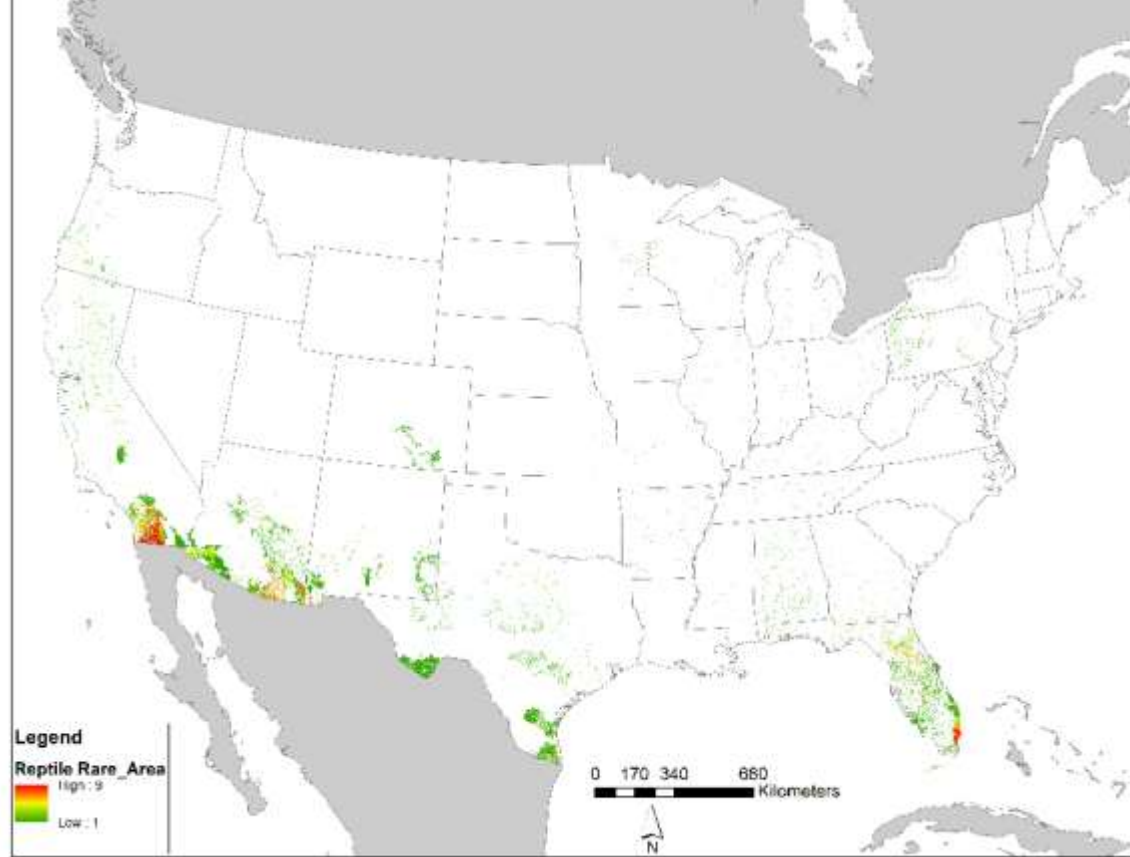

PARC Species

Rare Species

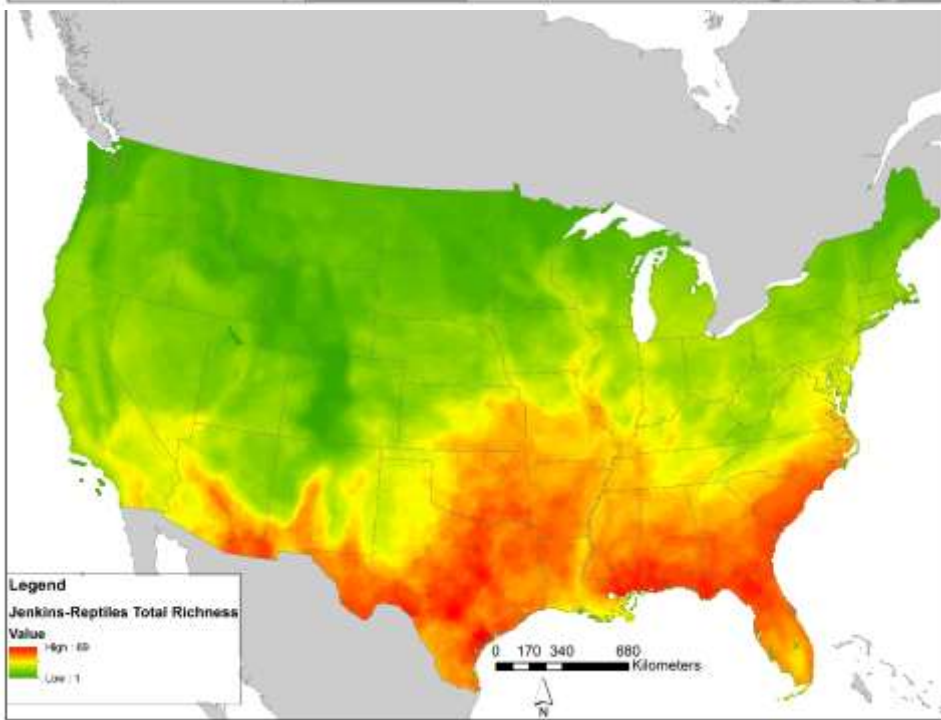

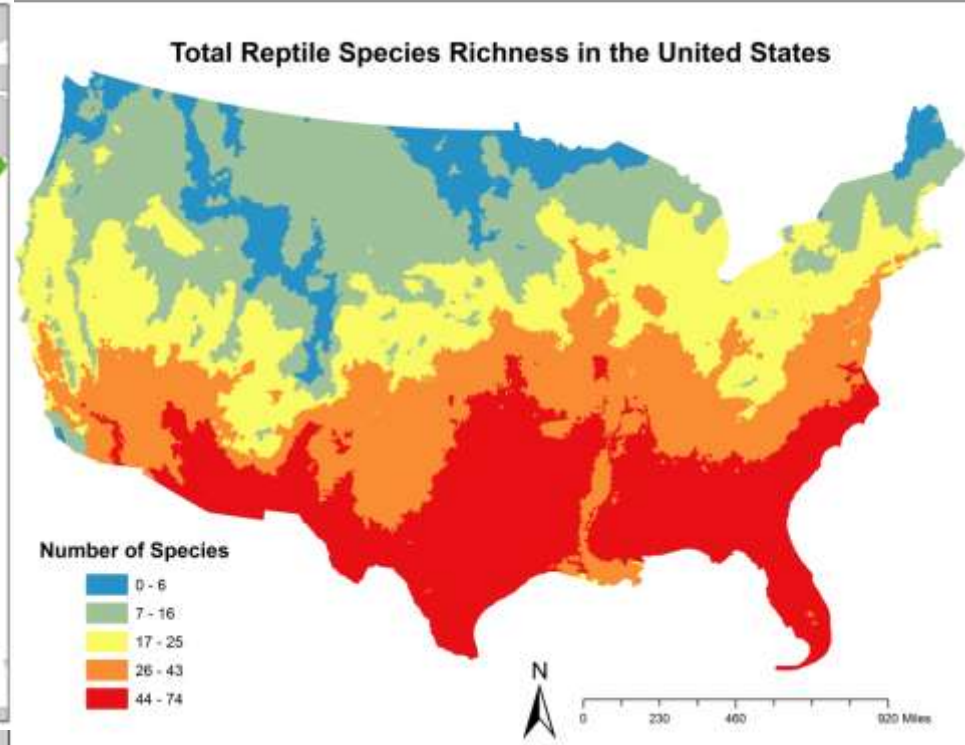

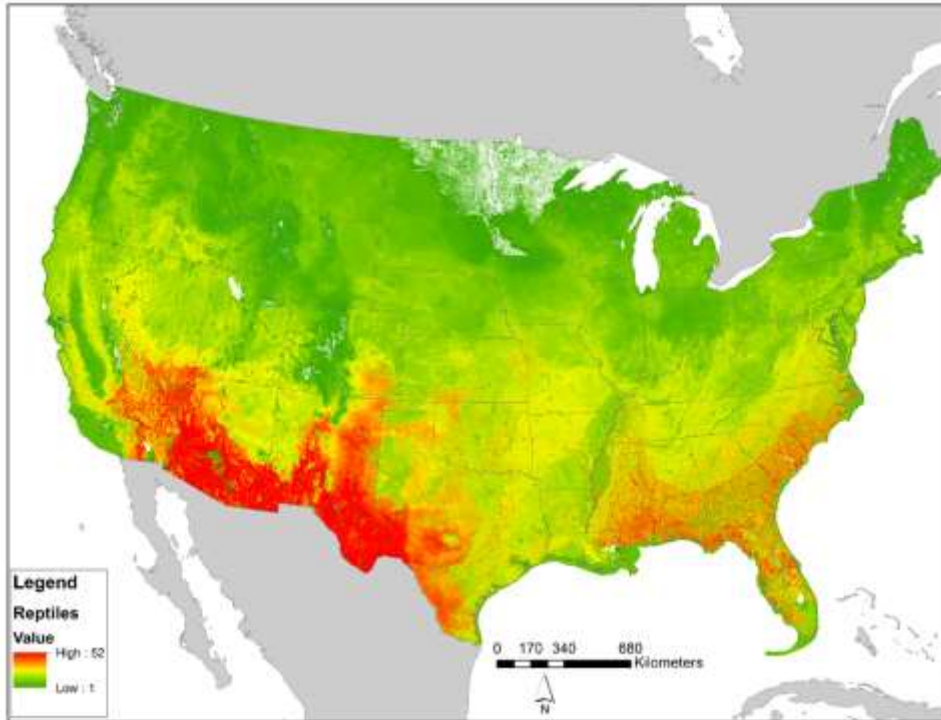

Rare Species

Rare (modeled habitat based) Species Richness by GAP Protection Status

Habitat Modeling: Deductive vs. Inductive

- Deductive (GAP Standard)
 - Knowledge based/expert based
 - Habitat based
 - Top down- general to specific
- Inductive (Maximum Entropy)
 - Species occurrence based
 - Bottom up- specific to general
- Merge the two types
- Ensemble models

General Conclusions

- Process allows many perspectives;
- Responsive to needs of users;
- National level with moderate scale;
- Establish common sense *indicators of ES* for end-user and decision maker needs, e.g.
 - Landscape Conservation Cooperatives
 - State Wildlife Action Plans
 - Potentially also for IPBES, TEEB, GEO BON, DIVERSITAS, etc.
