

Floodplain Functions and Benefits: Using ecosystem services to advance floodplain restoration

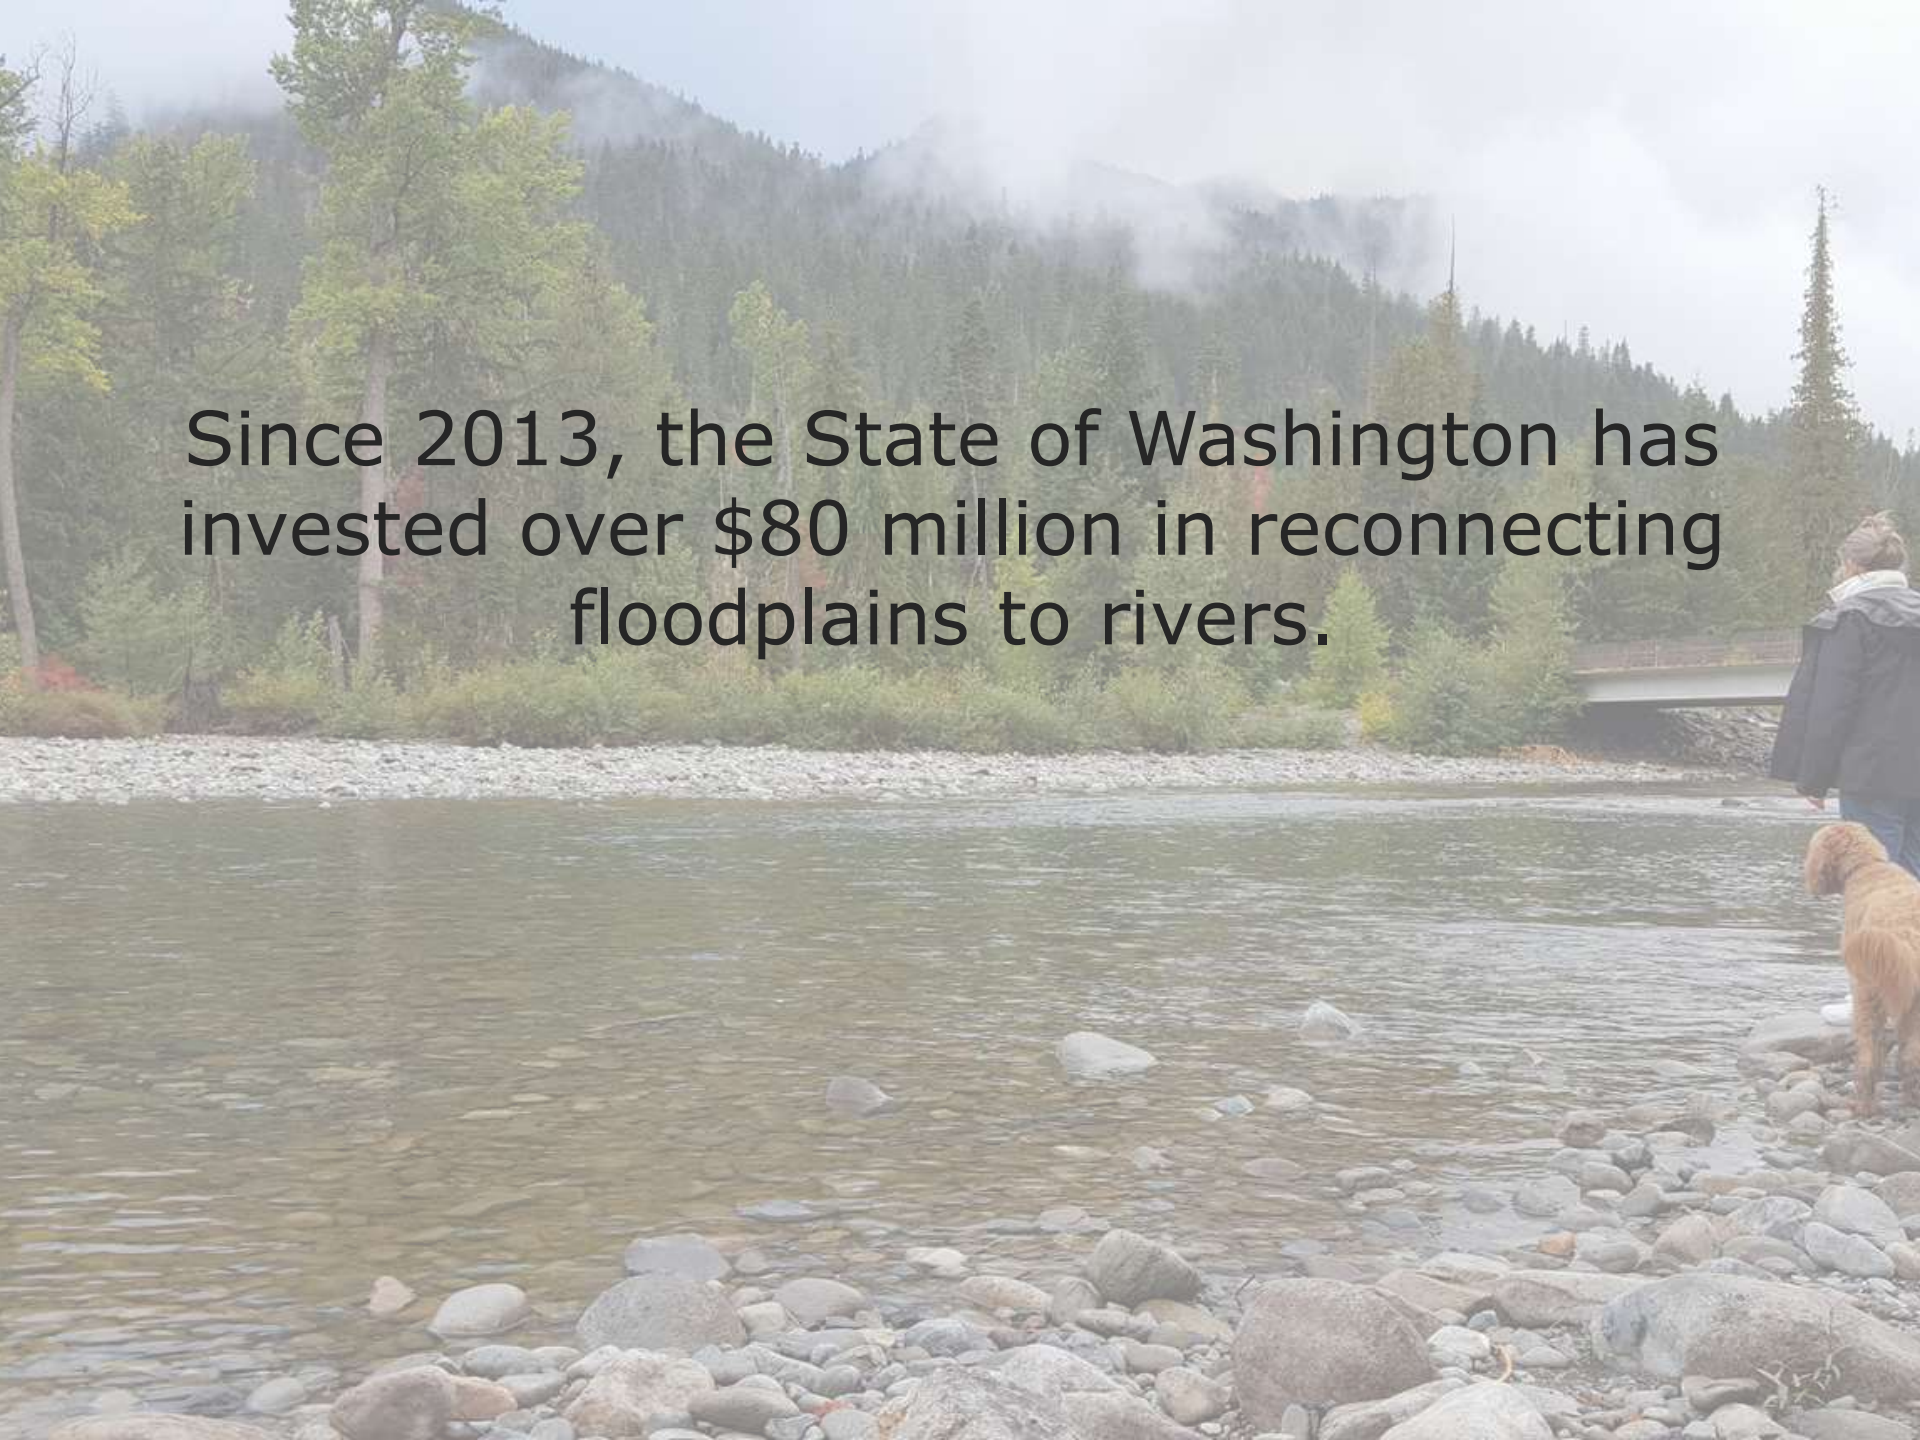

ACES 2016

Jonathon Loos

Lapham Fellow, American Rivers

American Rivers
Rivers Connect Us®

Since 2013, the State of Washington has invested over \$80 million in reconnecting floodplains to rivers.

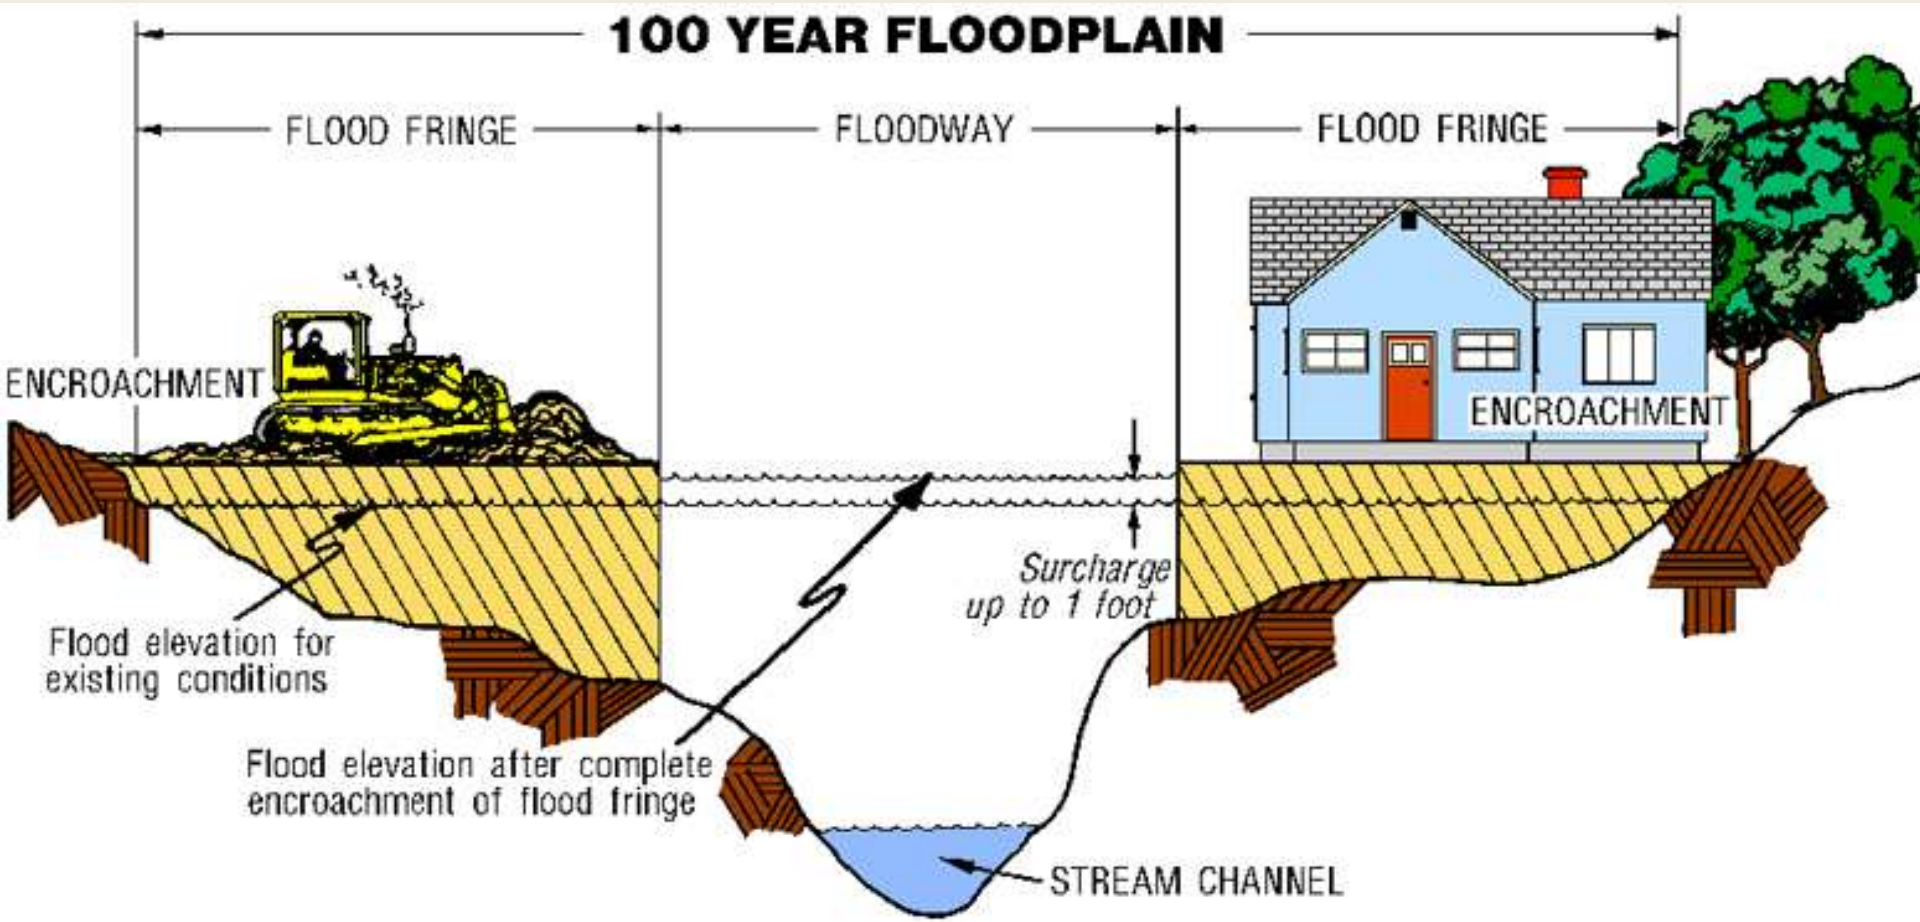

Overview

1. Linking floodplain functions with ecosystem services
2. Identifying our ecosystem service toolbox
3. Applying the toolbox to restoration projects
4. What's still needed?

Not your Mother's floodplain...

South Fork Sauk River, WA

Natural floodplain functions

- Support complex habitat
- Regulate water quality
- Recharge groundwater flows
- Convey floodwaters

Floodplain Disconnection and Modification

Sacramento River, CA

What attributes drive floodplain functions?

Connectivity

Variable Flow

Spatial Scale

Habitat and Structural Diversity

Attributes

Functions

Connectivity

- Floodplains convey floodwaters
- Supports natural shifts in channel and floodplain morphology overtime

Variable Flow

- High and low flows occur
- Exchange of nutrients and sediment between land and water
- Connects in-stream and riparian habitat

Spatial Scale

- Wetland and side-channel habitat are sustained
- Wider hyporheic exchange flow paths
- Conveys small and large magnitude floods
- Gradients in disturbance frequency and hydrologic connection emerge

Habitat and Structural Diversity

- Habitat mosaics develop overtime
- Supports diversity of species and life-histories
- Habitat temperature gradients emerge
- Floodplain surface roughness enhanced

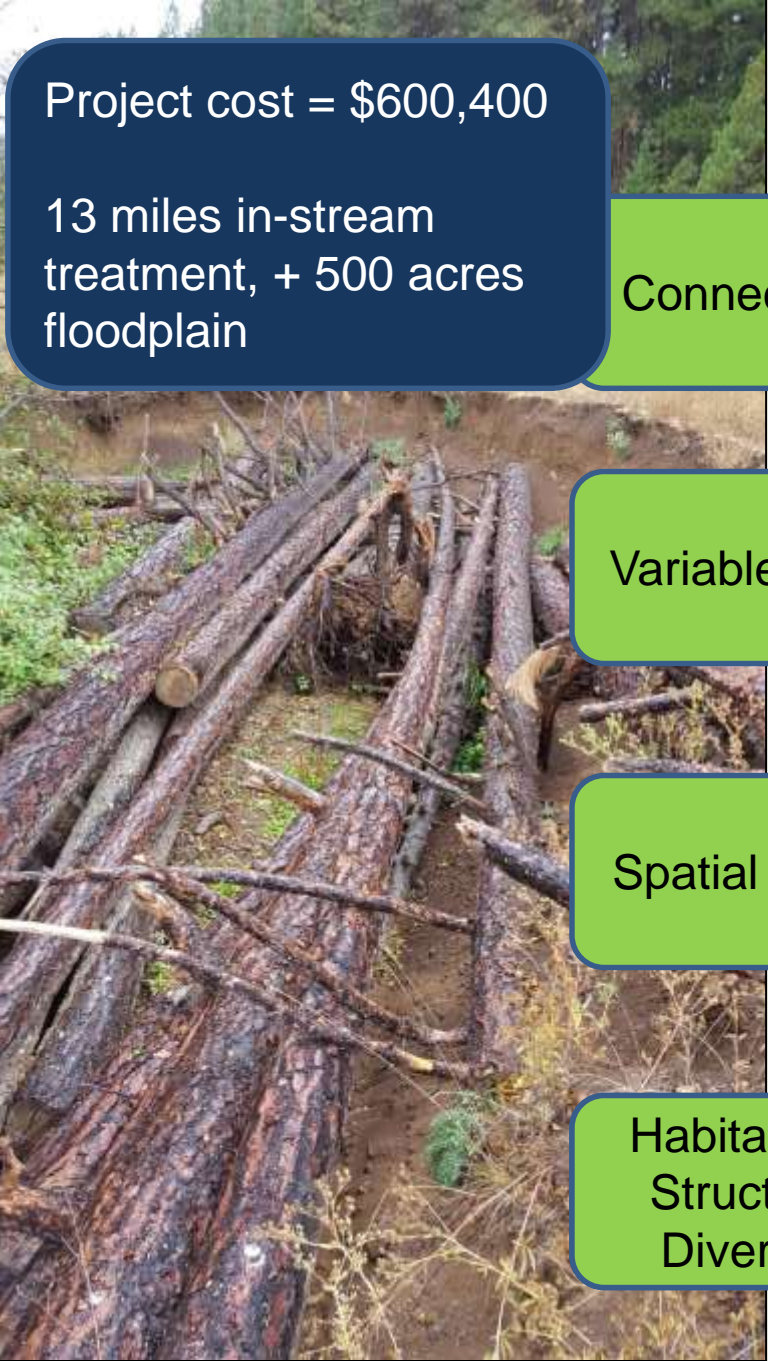

Ecosystem
Service Flows

Using an Ecosystem Service Toolbox to Advance Restoration

- Identify which services are applicable to the socio-economic and ecological landscape
- Clearly link restoration actions to ecosystem services
- Articulate multiple-benefit outcomes

Project cost = \$600,400

13 miles in-stream
treatment, + 500 acres
floodplain

Connectivity

Target Ecosystem Services

- Surface water and groundwater supply

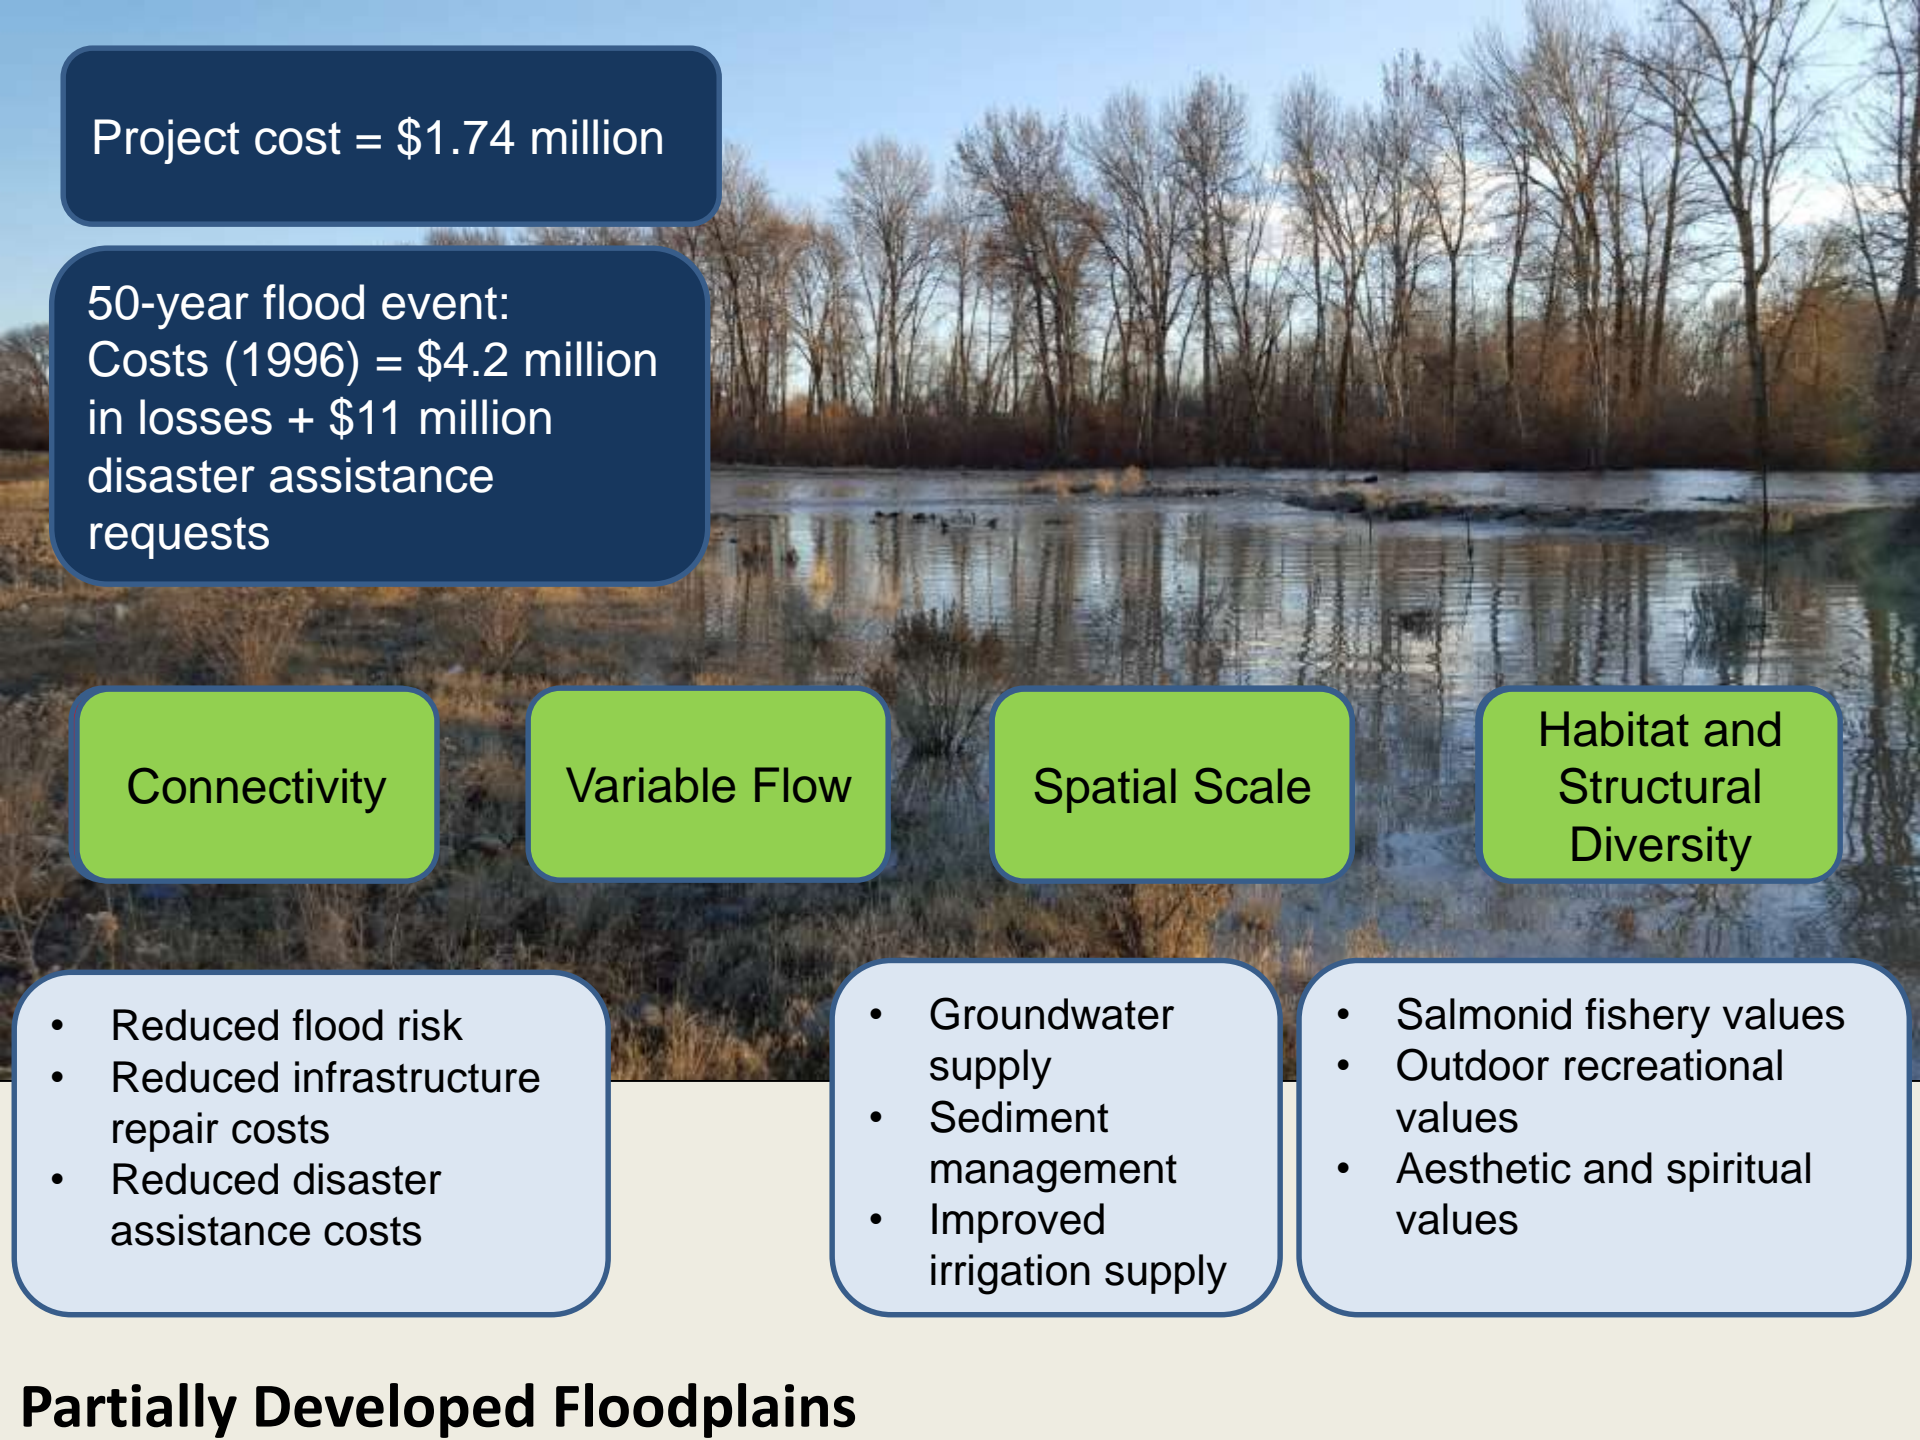

Variable Flow

Spatial Scale

Habitat and
Structural
Diversity

- Salmonid fishery values
- Outdoor recreational values
- Aesthetic and spiritual values

Floodplains in Headwaters and Open Lands

Project cost = \$1.74 million

50-year flood event:
Costs (1996) = \$4.2 million
in losses + \$11 million
disaster assistance
requests

Connectivity

Variable Flow

Spatial Scale

Habitat and
Structural
Diversity

- Reduced flood risk
- Reduced infrastructure repair costs
- Reduced disaster assistance costs

- Groundwater supply
- Sediment management
- Improved irrigation supply

- Salmonid fishery values
- Outdoor recreational values
- Aesthetic and spiritual values

Partially Developed Floodplains

Levee improvements 2.7 miles = \$18 million

Connectivity

Variable Flow

Spatial Scale

Habitat and
Structural
Diversity

Target Ecosystem Services

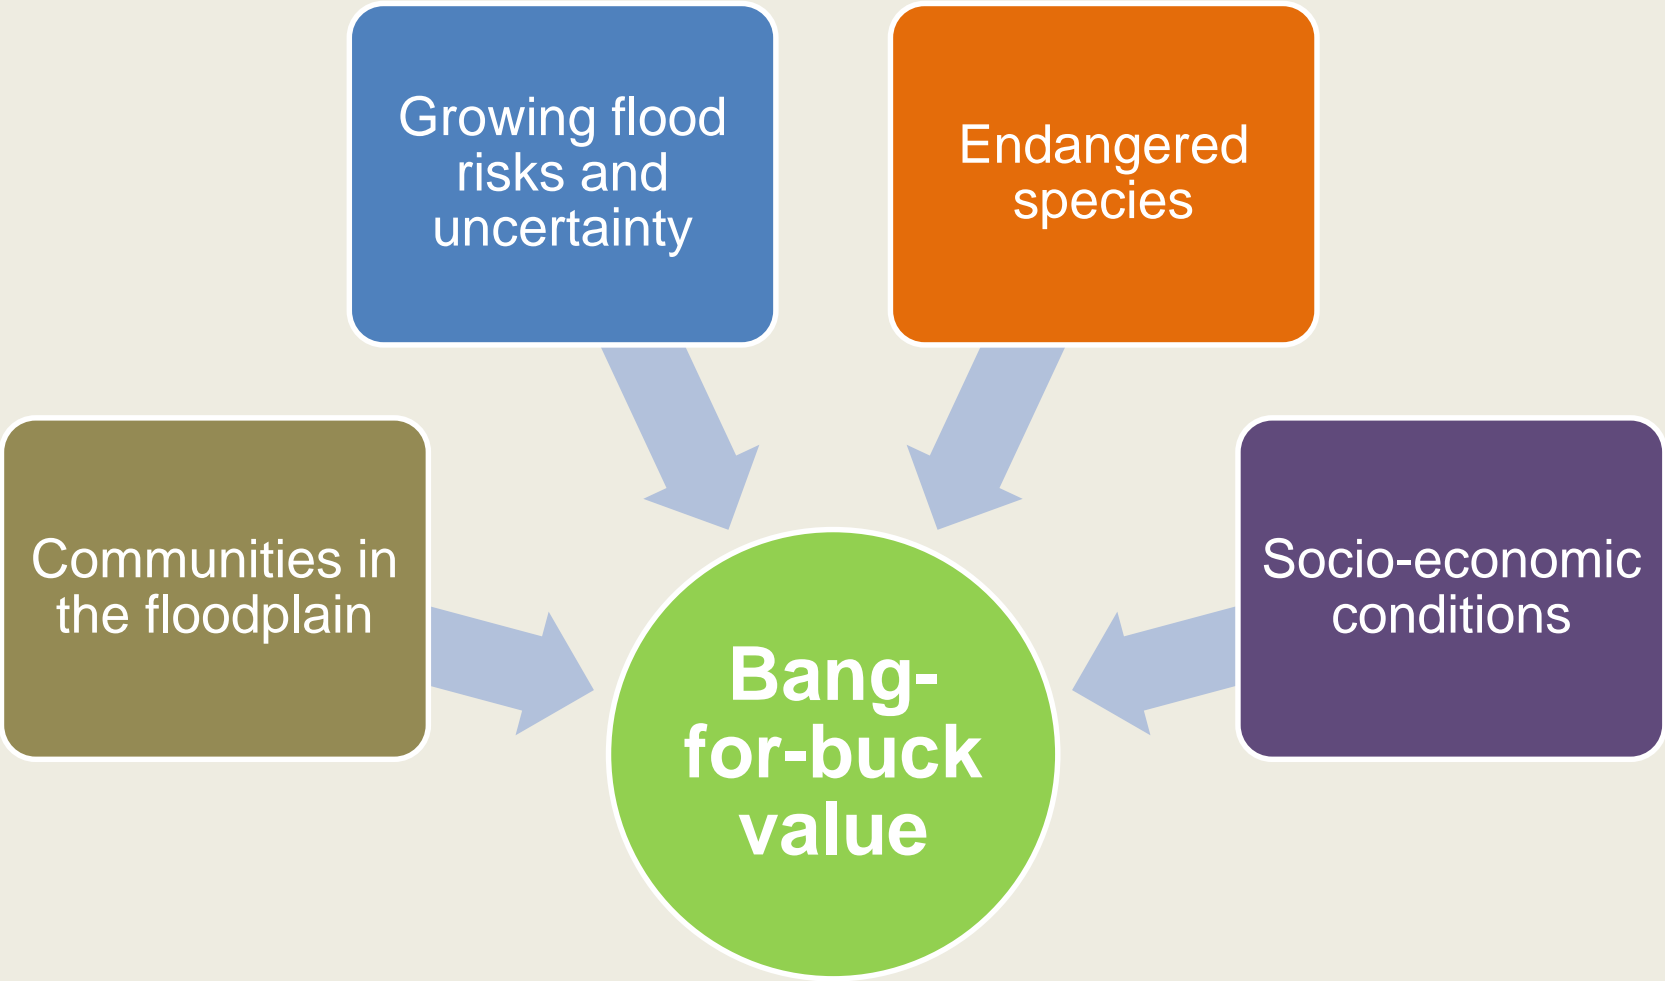

- Water quality maintenance

- Salmonid fishery values
- Climate resiliency and adaptation
- Aesthetic and spiritual values

Urban Floodplains

Recognizing the Right Ingredients

What's Needed Moving Forward

- Proven metrics for measuring outcomes
- Shared standards for delineating floodplains from the 'floodway'
- Shifting perspective on costs, risks, and benefits
- Revising floodplain management today, to avoid the need for restoration tomorrow

Questions?

IT'S CALLED FLOOD
PLAIN BECAUSE IT
IS PLAIN THAT IT
FLOODS"
REMEMBER "93"
314-241-2122

Functional Attribute	Justification	References
Connectivity	A functional floodplain is physically accessible by water from its adjacent river or stream to allow an exchange of water, nutrients, sediment and organisms.	Ward et al. 1999, Rohde et al. 2006, Opperman et al. 2010, Matella and Merenlender 2014
Variable Flow	A functional floodplain is connected to a river capable of producing flows with magnitudes large enough to inundate the floodplain. Additionally, a river must produce such flows at specific times of the year, for adequate spans of time, and at variable return frequencies to maximize a full range of ecological functions. Together, variable flow describes the necessary timing, duration, magnitude, and frequency (TMDF) of flows that support local biota.	Poff et al. 1997, Galat et al. 1998, Rohde et al. 2006, William et al. 2009, Cain et al. 2010, Opperman et al. 2010, Matella and Merenlender 2014, Dixon et al. 2015, Yarnell et al. 2015
Spatial Scale	A floodplain must have the space to accommodate inundation and the resulting habitat and landscape forming processes that occur.	Tockner and Stanford 2002, Opperman et al. 2010
Habitat and structural diversity	A diversity of sediment erosion and deposition conditions, gradients of hydrologic connectivity, ecological succession and naturally accumulated debris generate habitat supportive of terrestrial and aquatic organisms. Ideally, these features emerge from co-occurrence of the previous three attributes.	Galat et al. 1998, Ward et al. 1999, Stanford et al. 2005, Whited et al. 2007, Jeffres et al. 2008, Opperman et al. 2010, Tockner et al. 2010, Gunerlap and Rhoades 2011
